DH> Dan, KB1RT

IR LED makes quite sensitive IR receiver. Just power up the mystery
diode near it and measure the voltage across the leads using a DMM.

There is no scam. Radio Mart is a legetimate e-Bay reseller
of refurbished ham radio equipment and accessories. There is
no difference between how Radio Mart does business and
other retailers like HRO, AES and others.

The problem here lies with a few usenet knuckleheads and cheap bastard
hams who pontificate about all so much 'sour grapes' over them.
(most or all of em' being ex-hamfest dealers who just don't like e-Bay!)

Something, in perspective, so common of the minority of cheap
ham radio op's we all used to see at the hamfests years ago.
The hams that used to walking around in dirty 10 year old clothes who
never had a good word for anything or anybody so they cast
their bile on that which they could or would not simply walk away from
because the radio on the table was "too expensive" for them. In short
it's cheap-assed cranky old men who act like spoiled 8-year-olds.

If they don't like Radio-Mart you'd think they'd just go buy new
stuff at HRO and AES. R-M has to be doing something right as
it appears each and every auction they put up ends with someone
bidding on something. I say more power to them, and if someone don't
like how they do business, they can go down the street to the next corner
Deli on the block and get a pastrami-on-rye from them instead.

3. Re: Ground Plane construction vs pre-printed "protoboards"

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-01 15:56:23 UTC
From: dkelly42@cox.net
Message-ID: <1136130983.382349.266100@f14g2000cwb.googlegroups.com>
Source record: 14904

For years I designed my boards in a time consuming way. I used Microsoft paint to draw the pattern. I printed this pattern on clear piece of 3M transparancy using my copy machine at work. Later I used my home laser printer. I cut and cleaned the board like Richard Hosking suggested. I then ironed the pattern on the PC board using a home cloths iron. I used doubled sided PC board. I have always surface mounted all my parts even leaded types. I used the lower side of the double sided board as a ground plane drilling holes only to attach ground leads below. I also placed as much ground plane on the surface of the board as possible.

This method always worked well but I must qualify my building as being between 1.8 and 30MHz, nothing higher. In the last 7 or 8 years I have gone to Ugly construction. I read a quote attributed to W7EL Roy Lewellen about ugly construction years ago. The method I used was time consuming. I could save patterns for reuse and dupication but the whole classic PC board process is time consuming. I tried Roy's suggestion and never went back to my time consuming process.

My first project years ago was updating a drifty 40M VFO. I measured the drift in the old VFO to >200 cycle/hr after 20min warmup. The new VFO using ugly construction measured at <20 per hour after warmup. Both used the exact same circuit, roughly the same component values but different manufacturer so the comparison is somewhat flawed. Recent projects using ugly construction: An new HB RF signal generator, 6W sideband transceiver, logarithmic RF detector and a 1.7 to 1.85MHz LO for a new sideband transceiver. This new VFO drifts <10 cycle/hr (47 cycles over 24hr) but is still open to the environment on the workbench.

I have used ugly construction in tube rigs, VFO's, high gain audio sections of DC receivers, test gear, etc. The one thing that makes it appealing is the ability to test a circuit or idea without going into the long process of PC board prep. The ugly method is intuitive and my opinion...damn the appearance....does it work well!

Don K5UOS

PS John Miles' receiver is amazing! Wish he lived near me.

Radio-Mart(RM) is a deceptive seller that has cause more than a few
buyers to get negative feedback. I like how the R390A he sells is
Collins "designed", which is not the same as Collins built.

If Radio-Mart(RM) was an honest broker, then there would be no need for
the private sales.

I often see items for sale from Radio-Mart(RM) that I want, but I won't
buy from Mr. Red Velvet. Just wait a bit longer and a better deal will
show up on ebay. There is no need to deal with Radio-Mart(RM).

I need to replace an oscilloscope that has gone to the Great Test Bench
in the sky.

What Tektronix scope do you prefer?

I have always like the 7000 series...would you recommend these or
another series?

Thanks

TMT

I use the new Tek DPO scopes for most work, but keep 7904 (500MHz) with
high speed plug-ins and samplers for the times I need analog.

You can get 7k scopes for almost nothing. The DPOs will cost a bunch.

Steve.

The 7000 series is hard to beat. It's stable, it's not that hard to
work on, and there are plenty of useful plug-ins available at reasonable
prices.

That said, I still have a 545 on my bench at work. The calibration contract
just went over to a new company and the new cal guys aren't really sure what
to make of it....

Goodness. I had to get rid of a couple of 545s years ago (no room to keep them
).

My current scope at home is a 465. Basic but nice.

Graham

~~~~~~

Depends on what you want to use it for.

If you want an older, inexpensive, general purpose 100 Mhz scope, I
think the 465B (not the 465) was the best Tek ever made. They sold for
about $2500 back in the '70s and were worth every penny.

Ok, I'm a bit prejudiced because I worked on the production line for
both models for three years, testing and calibrating. In that time I
did about 2000 of them.

They have been out of production for more than 20 years now, but a
good one can still be had. Shop around. Tek built them to last.

73, Bill W6WRT

p.s. Actual quote from a Tektronix customer: "I gave my purchasing
people instructions that they can buy any kind of scope they want, as
long as they are blue and come from Beaverton, Oregon."

I finally sold off my great Tek 475 and picked up a Tek 2440 -- nice to
be able to "save" the display and then be able to make measurements on
the signal at your leisure. Especially nice when looking at the slew
rate of the slower op-amps.

Do you prefer Analog or Digital? Do you have room for an old tube
mainframe scope, or prefer a "portable"?

I have a Tek 454 that I got at a company auction years back where
I used to work (paid $150 for it). The 453,453A,454, 454A series
are easy to work on, and parts are available from many sources
(the nuvistor tubes in the front end and the tunnel diodes in
the sweep circuits can be a bit hard to find, but are available).
The 485 is a look a like that is all solid state with higher BW
but many do not consider it as good a scope design. I would not
turn one away if it were cheap enough though, when working they
do a good job.

The 453,454,485 scopes have a good CRT that will give years of
service. I've been told that the 465-475 series (larger tube)
will suffer from CRT burn-out eventually, the 453-454-485 scopes
rarely need a new crt. (The company where I got the scope from
had bought spare parts to keep all their scopes going, they NEVER
replaced a 453-454 crt but used up all their 465-475 crt spares).

Tek 475.
I have fancier scopes that do fancy stuff, but the 475 is an all-time
classic par excellence. I love it so much I also use it as a
decorative centrepiece for the dining room table.

"Radio-Mart isn't doing anything different than the normal used gear
seller... he just doesn't hide his practices as well. Millions of
salespeople use these tactics all day long."

Nice justification. I'll be sure to ignore your advice in the future.

Radio-Mart is into buying radios on Ebay and then turning around and
selling them on Ebay for a higher price and pocketing the difference.
It makes perfict sense to look for radios that are undervalued and then
resell them. I and most other people have no problem with that. The
problem is he does not tell the truth about where he got the radios and
the condition of the radios. I don't understand why he is compelled to
do tell stories about the radios he sells but it does not generally
cross the line into outright fraud and treads around in a grey area so
he will continue to be controversial topic in the news group. Going
"private" will further take his sales into the grey area and apparently
that and the story telling are risks he is willing to take. Buyer
beware.

I have not contacted nor am I aware of anyone else who has contacted
bidders about Radio Mart auctions. They may have read about him on
Usenet, which would eliminate any reason to contact them.

I don't care one way or the other about Radio Mart but people that buy from him should be informed about the way he conducts his business.

Yeah, right! I've been ripped off by that bastard too(along with
numerous others). Claimed the radio was near perfect, found it had been
repainted (not discernable from poor photo) and it smoked after I got it out
of the box. Lets not forget the Shill Bidding he does from his gottahaveit
account!!!!!!! Don't try to defend him, he keeps getting the same negatives
after all these years which shows us, he's still playing the same games with
some defective gear and covering himself with the "Private Sales".

Until last month I'd treasured my Tek 7633. Cost the eqiv' of only $60, yet
gave 5 years continuous, unremitting, troublefree service. Lovely bit of
kit. Looked right, felt right and offered a vast, soul pleasing array of
buttons and knobs.
Switched on with the fan purring away, I knew that I was at one with the
world.
Sadly, the display character generator started to fail. Even bought a
service manual and had a poke about. Joy was not to be, a Tek chip was
giving up the ghost. I knew then it's life was drawing to an honourable
close and another Tek scope would have to be sought.
I'd previously fancied the more modern Tek 2445, so downloaded a service
manual.
Shock-horror!, perusal of the circuitry revealed that there is nothing in
them other than a few special Tek chips.
Ended up buying a 100MHz Hitachi scope (equiv of $160). It does much more
than my old Tek, having benefit of modern uP aided cursors and measurements
etc. It's also smaller, lighter and repairable.
I love using it but I can't help feeling there's something missing that's
really crucial. Something that raises an instrument from the status of
'nice' to that of 'beloved'. (probably the Tek fan :).
Obviously I need to get out more.
regards
john

I've got a 2445, which I've had for about six years. It was the first equipment purchase made when I started a new job; it was purchased reconditioned from Tucker. I inherited the scope when that employer went bankrupt. I enjoy it very much, but need storage... I have a TDS210 (same provenance) which is pretty good, but I lust after the HP scope I have at work, which has two analog channels and 16 digital channels, and LOADS of memory... *sigh*. So many projects, so little time and money :)

I have used a 7603 for about 15 years for general troubleshooting, and it's my favorite scope. It's rock solid, and bright and sharp. I haven't been able to find a horiz plug-in with TV sync, but the trigger is so good I can get it to lock on video anyway. Only problems are the huge Mallory capacitors in the power supply that will open without warning. Replace all of these and you'll have no trouble at all.

John

I love my 465B, depends on what you need in a scope though.

Here is a link to the Tek forun on Yahoo,
lots of great info on new and older models.

perhaps you can make a few bucks parting
out the older scope.

7104 is an even nicer analog scope, with its phenomenal writing rate.

A used 11801 or 11802 and a sampling head will get you a 12 or 20 GHz
dual-trace digital scope for under $2K, a *much* nicer sampling system
than the 7000-series stuff.

My everyday scope is a TDS2012, which is great for most things. You
can take beautiful photos of the color screen for engr notes, manuals,
or test procedures.

Great plugin: 7A22 (or 1A7A, for the 547) which has switchable
bandwidth and differential input down to 10 uV/cm.

My favorite for LF analog work (<200MHz) is the is the Tek TAS485 They
stopped making this, along with all their analog scopes, which is a cryin'
shame, since digital really isn't good for everything.

Yup. Does everything most need from a scope. But in the UK, they still
fetch decent money.

Thanks for the replies so far...they are appreciated.

One feature of the 7000 series that I have appreciated is the plugin capability.

Spectrum analyzer, semiconductor tester, differential amps, etc. all add to its flexibility.

Does anyone have a history of the 7000 series?

Another issue I have seen with the older scopes is at least one can usually repair them....with parts from another parts scope. The newer scopes are reaching the point of throw away status with no parts available and if by chance they are, the price prevents a reasonable repair.

What you want is the book "Winning with People;The First 40 Years of
Tektronix",by Marshall M.Lee,published by Tektronix,10/86
There's no ISBN number,though.Maybe you can find a copy on Ebay.

It's a fantastic story about Tek from start to the late 1980's.
Unfortunately,it does not cover the decline of Tek.

You'll find them regularly on ebay btw.

I'd rather like a 2465 though. They do indeed fetch quite a fair price
still.

Hello Bill,
you specifically say "465B (not the 465) was the best Tek ever made"

Can you elaborate a little bit more there Bill. As a Tekscope
enthusiast, I am just interested to know what the improvements
were to the 465B over the 465 to make it more highly sought after.

Regards,
John Crighton
Sydney

Hello Ken,
I also have a Tek 454. I bought that model
because I read on groups like this that it is "easy"
to work on. I must respectively disagree with you.

My 454 is "not easy" to work on and yet I see people
saying that it is. I am just wondering if you are repeating
what you have read on the internet supporting a Myth
that the 454 is easy to work on or speaking from
practical experience.

I would like to clean the switch wafers of the main
timebase switch. My 454 is put together like an onion.
How do I "easily" gain access to this switch,
which is buried in the heart of the onion?

Slip the covers off your instrument, yes that is
very easy, a matter of seconds. Now have a look
and tell me how to clean the timebase switch?
How many hours would it take to remove the soldered
wiring off the boards so that they can be removed to
gain access to the switch and then solder the wires back
with nice factory quality solder joints, not with quick
blob soldering with insulation peeling back off the wires.
Quality work only.

Several minutes work would be easy if there was
connectors on the boards but not in this scope.
When we talk about "hours" we are in a different
category......pain in the butt/difficult.

How long would it take you, Ken, to clean the switch
from woa to go? Scope back up and working?

How long would it take you to remove the fan, fan wiring
tag strips and fan mounting brackets?
How do you get your screw driver on the screws holding
the brackets when there are modules covering them up?

Just have a quick look then come back and tell me
if you still reckon this scope is easy to work on, in the
inner sanctums.

Hi, Thanks everyone for the suggestions.
I tried putting 5 mA through it (approx 1.6v forward voltage) and examining it closely with a camera that I tested as being good at seeing IR and nothing showed. I am leaning towards the high voltage theory of two series silicon diodes in the one package. Anybody know a manufacturer of these sorts of things or even what the package type is called?

Paul.

I hope you're giving a hypothetical example, because if
you really do need to "clean" a Tektronix scope switch,
your scope may already be a lost cause. Time to move on.

In spite of having the number in common, the 465 and 465B are
completely different scopes. Their performance specs are nearly
identical but inside the box, their circuitry is completely different.
The "B" is much easier to calibrate and uses soldered-in transistors
instead of socketed ones, a great advantage especially when the scope
gets old and sockets start to get cranky.

I wouldn't turn down a 465 if that was the only thing available, but
all us calibration techs greatly preferred the 465B.

John is right. Tek scopes are not "easy" to work on, at least not the
solid state ones.

My first day on the job as a 465 calibration tech I went home with a
headache and almost called in the next day and quit. I had done TV
repair for 20 years but had never seen such complicated, unfamiliar
circuitry or construction. Fortunately I stuck it out and came to
appreciate them for what they were: The best scopes in the world.

~~~~~~

If Tek scopes of that vintage have one Achilles heel, it's the tiny
fork-shaped switch contacts used in many places throughout the unit..

Rarely do they need "cleaning", but rather the contact presssure needs
to be increased slighty. If you know how to do it, it's a quick, easy
fix, but if you don't you can easily destroy the contact.

Because the "fork" of the switch was designed to press against gold
plating, they made the contact pressure as light as possible to
prolong the life of the relatively soft gold. In some cases, it is
just too light and erratic operation is the result.

Here's how to do it right: With a small screwdriver, gently push
against the "U" of the fork, just a tiny amount. The idea is you want
to bend the fork down WITHOUT bending the spring it is attached to.
Under no circumstances try to bend the spring or you will almost
certainly destroy it. Bend only the little gold fork, and bend it only
a very small amount. Done right, it works every time.

Probably the easiest is to obtain one of the original power supplies.

Most installations using the RT-70 were in conjunction with an RT-66/RT-67
or RT-68 and an audio distribution amplifier. A separate vibrator power
supply was supplied those cases where the RT-70 was used 'stand alone'.
One approach to homebrewing a vehicular power supply is to mimic the
original vibrator supply. Provide the heater supply through dropping
resistors and emulate the vibrator supply by building an inverter using a
pair of switching transistors and a junk 60 Hz power transformer.
Regulation isn't necessary if you get the right transformer. The only
thing the least bit tricky with this approach is properly snubbing the
primary leakage inductance to prevent destroying the switching transistors.

Probably the most compact approach is to build a flyback supply with both
a six and 90 volt output. Regulate the 6 volt output and let the 90 volt
output track. The advantage of the flyback supply is that it can be
designed to operate over a wide range of input voltages while maintaining
a regulated output. In addition, the overall size will be much smaller due
to the high switching frequencies (300 kHz typical) used by modern flyback
controller chips.

Well, it's easy compared to other solid state portable Tek scopes.
Its main advantage is far fewer impossible to find custom parts like
all the later solid state scopes.

Actually this raises the next question that I was going to ask...."What is the easiest Tek scope to work on?"

As I have mentioned before I tend to favor the 5000/7000 line because of the flexibility but my options are open for the next purchase.

I have mentioned that the newer used Tek scopes I have looked into did not seem to have repairability designed into them. I have also heard of more than a few horror stories of parts being unobtainable.

Trust me, I don't bid on Radio-Mart (RM) gear. Long before I knew he
was a crook, I saw a radio he had for sale that I wanted to bid. The
private sales turned me off. My thought was what does this asshole have
to hide? The private sales are the perfect way to do shilling.

If Tektronix scopes are still as good as I've always known them to be,
then the only consideration should be your budget. Then get the
toppest-of-the-line you can afford.

Have Fun!
Rich

49. Weller parts closeout Washington DC area

Newsgroup: rec.radio.amateur.homebrew

W. S. Jenks has been having a close-out of excess Weller soldering
inventory.
Some prices good, others as expected in marketplace

Of note for homebrew builders are soldering tip prices for the
"PT" (Weller TCP series stations) at $ 3.62 each

"ET" (Weller EC series and WES51, WESD51 stations) at $ 3.41

IF your are a "Lead Free" assembler - you inquire with Jenks -- since many
distributors are clearing their inventories of earlier products (tips) not
suitable for upcoming "Lead Free" assembly requirements in production
assembly & mfg. rework.

TC205 sponges (most Weller iron stands) .. 66 cents each

They also have earlier Ungar, Edsyn, Antex and Wahl soldering products on
sale as well.

Reading the thread on the Voltaic pile in sci.chem.electrochem.battery,
I started considering what would one have to do to build a "Robinson
Crusoe" battery to power equipment in an emergency.

Assuming a battery of 12v and respectable current to power
communications equipment, how would you do it?

What materials would you use?

How would you charge it?

I look forward to your contributions.

I came across this on the 'net, which may or may not be useful in your
particular case, John...

How to FIX the Fuzzy/Wide Trace on Your Tek 465 or 475 Scope!

Cleaning the Volts/Div Attenuator Switch Contacts in Tektronix 4XX
Oscilloscopes

It might work wonders for your classic Tektronix 400-series scope.
And you can probably do it yourself, even if you've never opened a
scope, before!
(C) Copyright 2004, by Thomas P. Gootee

Here is a copy of the procedure that I sent to a guy with a Tek 475
that had a fuzzy trace, and "distorted" when he adjusted the volts/div
knob. His original email is below, followed by my reply.

--------- Original message --------
From: "Mike D"

To: "tomg@fullnet.com"
Date: 01-30-03 08:41

Do you repair scopes? I have a tek 475 that powers up but is very
fuzzy and distorts when adjusting the volts/division knob.

I don't know if its worth repairing or if you can reccomend a better
scope from your stock for a comparable price.

Thank You

Mike

Mike,

Yes. I do repair *lots* of oscilloscopes. I do it mainly for in-house
instruments that are to be resold. But, I also do it occasionally on a
fee-for-service basis.

The symptoms you describe sound familiar and it sounds like a pretty
easy repair job, which I could complete for $50. However, depending on
your location, if you are in the continental USA, the shipping could
be $20 to $30 or more, each way.

So, let me tell you what I would try first and maybe you can do it
yourself. (I'd hate to see someone spend more than $100 for something
that they might be able to do in less than 30 to 60 minutes.)

Without seeing the scope myself, I could easily be wrong. But, from
your description, my opinion is that, most-likely, the switch contacts
in the volts/div attenuators (and/or also in the trigger-view and
bandwidth-limiter) are dirty or oxidized.

They are very easy to get to and to clean. And, although it might
sound a little daunting to a first-timer, it really isn't difficult at
all, requires only very-basic tools and supplies, and will probably
work wonders for your scope's performance.

Here is the basic procedure:

Unplug the scope and place it on a large, flat, smooth surface, such
as a table or floor.

Remove the scope's case: Start by removing the four screws in the rear
panel's cord-wrap feet. They may be either Phillips-head or "star"
(Torx) types. The feet may come off along with the screws. There are
usually also two other screws, near the top and bottom of the rear
panel, in the center. Remove them, too. After all six of the screws
have been removed, rotate the carry-handle up and out of the way of
the front panel, probably to the "straight up" position.

It is recommended that you stand the scope on its front panel end and
pull the case up and off. But, if you DON'T have a front panel COVER,

you can either try it anyway, hopefully on a padded surface (and carefully!), or else just leave the scope sitting on its feet.

From the rear of the scope, with your fingers on the sides of the case, push on the rear panel with your thumbs. If the scope is not standing on its front panel end, you will need to be very careful, as the scope slides out of the case, to also support the front end, keeping it up, so the bottom front edge of the case does not damage any of the internal parts of the scope by scraping against them.

Note that if the scope's CASE is DENTED, especially if it's dented on a corner-edge, it could be *VERY* difficult to remove the scope from its case! It might then require *QUITE* A BIT of brute force, pushing on the rear panel (or pulling on the edges of the front panel) and pulling on the rear edges (or pushing on the front edges) of the case. (Sometimes, in that situation, it helps to alternate between trying to move the left and right sides; and maybe even also to alternate between moving the top and bottom.)

After the scope is out (whew!), see the note in the next paragraph, and then carefully stand the scope on its SIDE, so that the vertical board, on the side of the scope, behind the v/div knobs, is facing UP.

NOTE! I usually try to lift and move the scope's internal assembly ONLY by the edges of the front panel (or CRT bezel) and rear panel, or other solid structural/steel parts. And be careful not to set the scope on any objects or uneven surfaces that might touch any of the internal components.

Just behind the volts/div knobs, inside the scope, there are two silver, metal "boxes", which house the attenuator/switch assemblies.

Remove all of the necessary screws to open the top of one of the boxes. (Do only one box at a time.)

Inside the box, there are four little rectangular, plastic "attenuator modules", each usually labeled with "somenumber X" (e.g. "4X"). Using a longnose pliers, or something similar (or whatever works), grasp one of them and pull *straight* up, to remove it. I'm not sure if they're static-sensitive, or not. But, just in case they are, I would lay it either on an all-metal part of the scope, or on a piece of aluminum foil, or something like that (i.e. on bare metal), with the pins facing down.

I usually only remove one attenuator module at a time, just so I don't get them mixed up. But you could do two at a time, if it's more convenient (which it often is).

While looking at the area of the circuit board where the attenuator module came from, rotate the corresponding v/div switch back and forth, until you can see which positions raise and lower the tiny gold U-shaped double-contact sets, up and down, from/to the circuit board.

Cut a small piece of clean, white paper, as lint-free as possible, into a thin strip, a little wider than one set of contacts, and long enough for you to handle/manipulate (probably something like three or four inches long and 3/16"-or-so wide?). Do not use cloth, which might snag, or anything abrasive. (You may need to cut new pieces, periodically, as you go through this procedure.)

Turn the volts/div knob, to raise the set of contacts that you're about to clean, up and away from the board.

Carefully slide one end of the paper under the contacts.

Apply a drop or two (or three) of isopropyl (rubbing) alcohol to the paper, under the contacts. It's OK to get it on the contacts, board, etc, too. I assume that the more concentrated the isopropyl is, the better. But I've had good results using the plain 70% drugstore type, and the 90% drugstore type. (The results would probably be even better if you use Caig's "De-Oxit" product, for the cleaning, followed by Caig's "Pro-Gold". They're available at Caig's Website.)

Immediately turn the volts/div switch so that the contacts are lowered against the paper and then (carefully!) pull the paper *straight* out from under the contacts. This should probably be repeated several times for each set of contacts.

Be careful. If you bend the contacts, you may be in trouble. And they are *quite* fragile. But, it should be fine as long as you try to pull the paper as parallel to the board as possible. Certainly, don't ever pull straight *upward* on it, and not even more upward than sideways.

Also, NOTE that a couple of the contact-pairs, the two that are nearest to the front of the scope, are raised and lowered by the AC/GND/DC lever-switch, instead of by the volts/div switch.

When all of the visible contacts have been cleaned that way, replace the attenuator module, carefully, by pushing its pins back into the holes in the circuit board and then pushing it all the way in. (It might not hurt to also clean the attenuator module's pins, although I've never needed to, nor tried to.)

[If you *DO* happen to have some of Caig's "De-Oxit" product, it might be good to apply a tiny amount to each pin of each attenuator block. I usually also apply it to the metal shield, wherever it makes contact with the screws or their mountings (and the the screw-posts/mountings themselves), and wherever the shield makes contact with any other metal surfaces, and also on those metal surfaces themselves. And the screws themselves should also be treated, as should any nearby "ground" screws (i.e. loosen, treat/clean, and re-seat). ALSO, make sure that you treat the grounding "spring" that protrudes up from one of the screws, where the crew touches it, and on its top where it touches the scope's case (and also do that part of the inside of the case). You can often SEE the difference in color of the metal, as the oxidation is removed, especially if you use the concentrated form of De-Oxit that comes in the small plastic "needle-dropper" bottle.]

Replace any attenuator modules that won't be in the way, any more. Then, remove the next attenuator module(s) and repeat the above procedures, until you've gotten to all of the switch contacts in the "box".

When one whole channel's switches are done, replace the metal cover over the attenuator/switch assembly and do the second channel in exactly the same way (or, what the heck, maybe *better*, if that was your first time...). [NOTE that the "fingers" that may be on one side of the shield/box need to go back into the same position that they were in before the top was removed.]

Now that you know what the tiny, gold switch contacts LOOK like, you will be able to much-more-easily find the SIMILAR ones that are on the SAME circuit board, but are toward the REAR of the scope, near the middle of the board. There is no cover over them. So they're MUCH easier to get to. There should be one group of four of them and another group of two of them. Moving the Bandwidth-Limiter and Trigger-View controls, on the front panel, will raise and lower them. Clean them in the same way as described above, for the attenuator switch contacts.

One OTHER thing to check: (I'm not sure, at the moment, if this is only for the 465 model, or if it also applies to the 475:) JUST behind the metal attenuator/switch shield "boxes", there may be a screw that connects a metal piece of the box/shield to the circuit board. If that screw is loose (which I have seen on about a third of the 465 scopes I've worked on!), or if it doesn't make good contact, you may see very noticeable effects in the trace(s), such as fuzziness or distortion, and may see trace-distortion effects when adjusting the trigger-level control (possibly especially-so at the highest frequencies), and possibly other triggering problems.

If cleaning the switch contacts doesn't fix the problems you're having with the "fuzzy" or wide trace, and the attenuator switch anomalies, further diagnosis and repair may be necessary.

Let me know if you try this, and how it works. If you would still like me to work on your scope, just let me know.

And let me know if I can be of more help.

Thanks again!

Best regards,

Tom

"Yeah, the 7000's make great boat anchors too ;) "

Actually the size has never bothered me.

If you look at the footprint a 7000 series scope takes and then compare
it to the space taken up by a supposely "portable" Tek scope, there is
little difference.

Also since my scope rarely leaves my test bench, the weight difference
(which is small) does not matter.

What does matter is dependability, reliability and cost....all factors
that the newer Tek scopes seem to fail at.

Seconded. That microchannel plate CRT is a thing of great beauty. I used to use one with the Polaroid film plate on the front when I was a grad student.

They had a pretty nice analog storage scope whose number I forget--it was a portable and looked a lot like a 485.

I have an 11801A that I use all the time, with the 40 GHz sampling head. I got it for about a fifth of the cost of the overpriced modern version.

LeCroy is selling a 100 GHz sampling scope, which uses the Picosecond Pulse Labs 100 GHz sampler. Used to be that LeCroy made nice user interfaces but couldn't build a vertical amplifier to save their lives.

Cheers,

Phil Hobbs

I wonder what you envisage as "respectable"? I guess 0.5 to 2 amps
might be useful. You would certainly want to minimise power usage in
an emergency situation.

>
>What materials would you use?
>
>How would you charge it?

I guess it mostly depends on what you have available.
Your assumption seems to be a "rechargeable" battery - but I suspect
that a primary battery would be easier.
For a rechargeable - a lead cell would be simplest provided you can
find some. If you cannot get acid - sodium bicarbonate works tolerably
well (it works quite well in a number of cells and does not cause the
"chlorine" problems of cells that use salt solution as electrolyte).
Other than having a few solar cells lying around (there are heaps of
them in garden lights in NZ), you might need to rig up some sort of
hand-cranked generator.

Primary cells using large areas of "plate" could provide some current.
I would say use a plastic buckets for each cell, or something of
similar size. Two litre milk bottles with the tops cut off might be
big enough, provided you can stuff enough connected plates in each,
using paper or plastic seperators.
The most common materials for the plates might be aluminium and either
tin plate (food cans), or roofing iron.

However, in the end I suspect that unless I were cast away on a desert
island with no batteries, I would be endeavouring to FIND something
that already works. There are batteries in many items these days -
from cellphones to garden lights to toys.

Much more important is how to keep them charged. This is where a large primary battery (supplying a small current at sufficient voltage), could be used to charge the NiMH and other batteries that are commonly found.

Just my tuppence worth.

Eric

I have thought about this before. I would hope there was at least some
wire to hook up the battery.

How would you make wire ? Maybe this island has some metal of some
sort on it for both purposes.

56. Reliable Inexpensive Electronic Weather Instruments

Newsgroup: rec.radio.amateur.homebrew

I am looking for any suggestions as to reliable inexpensive electronic weather instruments.

With several units that I have tested from places like Target, Walmart, Radio Shack I find that they are not repeatable, readings drift and will die when the weather gets cold.

Has anyone found a source or brand that they have had good success with?

Any leads or links to building your own instrumentation?

Thanks

TMT

In the 1960s Tek did sell a switch servicing kit for the
large dog kennel size 500 series models with wafer
style rotary switches. I remember a pouch containing
several bightly coloured pencil sized applicators of oil,
grease and various cleaning fluids.

"Time to move on" Oh no! I would never get rid of an
instrument for the want of a bit of effort. My 454 is now on
the reserve bench as back up scope number 3 behind a
couple of 465 scopes. My 454 has a nice clip on metal
cover to protect the front panel. This is the scope I am
more comfortable with lending to friends, knowing that
the front panel is not going to get bashed in transit in the
back of a car.

The slight intermittent problem with the timebase switch
is minor, I can live with that. My 454 from the late 60s
has big wafer switches just like the big 500 series scopes
so cleaning these big wafer switches is easy providing
you can get access to them. Access is the problem
in the 454.

Bill Turner mentioned the U shaped contacts in the
465. Yes that was tricky tending to them but they
are getatable. I would never dump a piece of test

gear because of dodgy switches. I just don't have
the heart to dump any test equipment. I should try
and be stronger but I can't. Being a test equipment
nut is a life crippling disease. :-)

Regards,
John Crighton

Everything is relative. If you think the 454 is hard to work on, you should
just SEE the insides of the 7000. Likewise the 7000 is a whole lot easier
to work on than the latest generation of digital scopes.

>I would like to clean the switch wafers of the main

If the switch wafers really are bad, the easiest thing to do is to use
Cramolin with a very long spray tube. You can get it into very small
places without having to do as much dissasembly. But make sure the
contacts are tight, first. I don't see contact cleaning needed on
the scopes of this era, although some of the older ones did.

I'm still mad at Walter for a dirty trick he pulled about 20 years
ago. I built an ff&f equivalent of his 4208 Camac 1 ns TDC module, at
a customer's request. So he cut his price in half the next time he
bid, specifically to kill me. The customer, bless his heart,
disqualified LeCroy on "technical grounds."

John

On the basic Tektronix thread, I still have this Tek 650HR with a luminance problem. It appears to be the "PLRT INV & TRIG PICK-OFF" chip, which is a Tektronix 155-0216-00. Earlier revisions used a Tektronix 155-0032-00.

Tek says support for the monitor (and probably for the rest of the Group 26 products) was discontinued in 1996. They can't tell me what the original manufacturer's part number is, or even who the original manufacturer of the chip was, and the service manual lists only the house number.

Any Tek technicians happen to have some of these in the junk box, or know what the real part number is? The input that takes the base comparison voltage from the aperture pot is pulling the input way down.

I've had that happen once. A competing company with nearly 20 staff
quoted 1/3 what I quoted for a design job.

The potential customer said, "Something's fishy", and gave the
contract to me.

a "Robinson Crusoe" battery must be one you'd make if stranded on an
island...
so you'd have plenty of sea water.
you could use electrodes of copper and zinc

Parts with numbers beginning with 155 are Tek designed and made - they had their own IC design and production facility. So that's the "real" part number. I don't know of any Tek made ICs for which anyone else makes an even roughly equivalent part -- if they did, Tek would have bought them instead of designing and manufacturing their own, which cost a small fortune.

get a bunch of coconut shells. place an electric eel in each. wire in
series. make odd numbered cells male eels and even numbered cells female
eels. that way you should have alternating currents :)

"reliable" and "inexpensive" are at best orthogonal, if not downright
contradictory...

I just want the stuff to work. Had a heathkit weather station for a
number of years, but when I worked 2m packet, it thought I was on
jupiter -- temperatures zoomed down and barometric pressure went
really, really high (and that was *after* I put RF bypassing on a lot
of high Z nodes, and shielded the thing).

I've had no trouble with the Davis Instruments stuff. Currently run
Vantage Pro2 stations at a number of locations, using the Weather
Display software.

It's not cheap, but it works.

T921/22 or T932/35,hands down.

No TEK-made ICs,simple switches,low parts count,all solid-state.
(excluding CRT,of course)
Easy to access all parts of the scope,better than any other TEK scope..

Just do not plan on repairing or calibrating them yourself.
Their "service manuals" have NO component-level schematics or parts lists.
Calibrations are done by PC-based software,and may call for test equipment
you don't have. Power supplies are purchased-parts.

The TDS scopes are engineered to be module-exchange repair only.

I've been wondering that too. I'd likely pick salt water electrolyte
and carbon and steel electrodes. Assuming there is no ready metal on
the island, hopefully there would be a zip on some clothing, a button
or something. Burnt vegetation could provide the carbon.

I found a little 1" or so bottletop sized cell gave in the region of
half an amp at 1v. The electrodes corrode quickly, in a day.

155-xxxx-xx and 234-xxxx-xx ICs were made **BY TEK**(they should have told
you that),and they sold off the IC manufacturing unit to Maxim,who turned
around and stopped making them,as TEK did not buy in the volumes Maxim
wanted.

NO other company makes those 155 or 234 prefixed ICs.

>
> Any Tek technicians happen to have some of these in the junk box, or

The one good thing is that the 155-0032-xx was used in a lot of TEK
products.You can find them in 465's,IIRC,on the trigger PCB.
Try Ebay,or search electronic salvage companies that sell used TEK
products.

I worked for TEK for 21.5 years as a service tech in their field
offices,repairing and calibrating scopes,TM500,and TV test equipment.

Don't you mean "not enough"? Two is sort of a minimum working level. 3
or 4 is nice to have! Can't beat the 465, 475, and 7000 series. Also
use the 305x series when I need storage, math, or documenation.

Here's a reference to 'Silicon Chip' magazine, who ran some articles about these devices.
http://www.siliconchip.com.au/cms/A_30674/article.html

I recall seeing a commercial unit which was a semiconductor equivalent of the vibrator, two AC132 transistors (IIRC) as a multivibrator running into a transformer. The article above gives enough hints to be useful though.

Here's some other useful links:
http://www.radios.freeserve.co.uk/vibrators/vib.htm

Woops, here we go, found the one I was after:
http://www.vmarsmanuals.co.uk/newsletter_articles/vibrator.pdf
Circuit for the solid-state vibrator.

Cheers.

Ken

Yes I agree everything is relative. An easy to repair
comment should be defined a bit better, perhaps
against time or compared against something else
say removing a hard drive from a home conputer.
Half a dozen screws and the cover is off,
Pull two connectors and remove two or four
mounting screws and the hard drive is out.
I would call that easy.
A job that takes less that 15 minutes I would say is easy.

I must admit I have never come across Cramolin. I will
ask around. If it is available in Sydney, I'll find it.

> I don't see contact cleaning needed on
>the scopes of this era, although some of the older ones did.
>--scott

Oh, I do!
Going by the dates on the boards, I am guessing that
my 454 was built around 1968 and has spent many

years in someones backyard tin shed. The aluminium metal work is slightly pitted meaning it has been in a damp area. There was no filter for who knows how long, one or two decades maybe longer, so the insides are quite dusty.

Two years shy of forty years of age and the scope still works. Bloody marvellous! Switches in that environment of damp and dust can't be expected to remain clean and reliable. I am just amazed that my 454 scope works as well as it does even with its dodgy switch.

Regards,
John Crighton
Sydney

My comment was based on what I have read. I have the service manual
for the 454 and it is a well written book. The 454 is a a well designed
scope, and parts are available. Fixing ANY high tech scope is NOT a job
for the faint of heart, but at least the parts in the 454 are not
so small (surface mount) that you need an electron microscope to see them!
The older tube based tek's are what you want if you want to restore a
scope yourself. However, if you want to buy a scope in working condition
that you COULD fix yourself (OK substitute the word POSSIBLE for EASY) then
the 45x series is about as "modern" as you want to go.

I just tracked down an intermittent in my 2467B's CRT supply, a process
that would have been a lot tougher if I hadn't had both my 485 and 2430A
clipped to various points. Scopes are cheap these days... you want at
least three.

I've found that the BF981 is lower noise than the BF964.

Does anyone know if it works as a direct substitute, or would I be asking
for trouble if I decided to do this?

Sam

Ken,
Remove the covers from your 454 scope and take a look
from the point of view of access to the inner assemblies.
I wonder if you still say that it is well designed?.
Deliberately threading bunches of wires (small loom) through
round holes in brackets or sub panels is weird. Why not slot holes
to the end of brackets/ sub assemblies/metal panels so that
the cable loom or wires can be slipped out of the slot if a
subassembly has to be moved. Threading wires through round
holes in small bits of metalwork so that they are tied in, I don't
like that sort of design.
No thought for the non Tek trained serviceman.

>Fixing ANY high tech scope is NOT a job

I settled on the 465 myself. The first was a goer with problems.
The little U shaped contacts that Bill Turner spoke off.
The second was cosmetically very nice but dead. Shorted tantalum
on the 15V suppluy.
The third was partly robbed of bits. Even had an IC fitted
back to front.

All three are working nicely now. I enjoyed repairing them.
You can get access to most of the 465s innermost parts. Not
a nightmare like the the 454 and yet the 454 gets a great right
up on many websites. I don't know why!
Sorry Ken if I appeared to jump on you.

In regard to the old tube monsters, I gave two of those
away to another enthusiast. 533A and 549.
Tubes cost a lot of money, I just could not afford
to restore them but the other chap is dead keen
to get them working. He has contacts in the US
who will send him parcels of junk picked up from
ham field days and trash and treasure markets.
He has put in his list of wanted items to his friends.

All good fun!

Regards,
John Crighton
Sydney

Scopes are cheap, however space is not, at least not here.

I've got two scopes, a 465B and an ancient but beautiful condition 531A.
I'd get rid of the 531A but I need to find a good home for it, it's in
great shape and works perfectly.

I will second this line of thought. I have worked on both, and
the 465's, and 475's are way easier to work on than the 453/454.
The 465M is modular, and was designed to be serviced by military
module swapping automatons.

And even easier still is the 2445, and 2465. The parts problem
is a nuisance, but the scopes are wide open, and put together
with the serviceman in mind. Not to mention the fact that there
is no scope, of any vintage, that is nicer to use than a 2465.

-Chuck

OBTW, on my bench, you will find a 585A, 475, 2465, 7633/7D20...,
and a 326.

Oh well, I also wouldn't give up the Tek 454 I have. the best animal in
the analog class.
May be the only concurrent from Tektronis would be a Tek 2465. you can
get one at about 0.6 kilobuck. very nice for the money, with one of the
best triggering circuits I ever saw in 35 years in the field.
Happy new year!

I use DeoxIT, works better and comes in a variety of applicators. In
Sydney you can get it from http://www.caprina.com.au/catp.html or see
Caig website for info and other locations, www.caig.com.
I use the deoxIT D5 and DN5 and their proGold products. Great stuff.
Mike

I worked on an old Nicolet The switches were terrible, most all of them.
I spent weeks trying to clean all the switches, mostly the rotary ones.
I had to use all my toughest cleaners. The hardest part was getting into the
partly sealed switches. I used my best cleaners, alcohol, Contaclean,
Alcohol-Cramolin, Buffrog cleaner. Over and over. I didn't use Deoxit, because
I ran out. Cramolin is no longer sold as Cramolin. Its called Contaclean by
the Cramolin Co. a German company. Available from InOne, Farnell.

I use deoxIt and progold (now DeoxIT GOLD) now since a friend of mine
received it in an Agilent test equipment at work.
I figure if it is spec'ed in there it must be the best. They have an
interesting site, with lots of information and ways of using their
products.
I have a treo 650 which was not charging and communicating - a few
wipes with Progold, oops deoxIT gold and everything is working
perfectly now.

Well, if you were shipwrecked, you might pry the anti-corrosion zincs off
the hull, and along with the bronze/brass fittings, you might get some
potential.

Of course, once you've used up the zincs, I think you're pretty much done.

>John

The 7603 is very nice. I use them for the spectrum analyser plug-ins as
the bigger CRT helps. But for normal trouble shooting, I much prefer the
7704A as the basic scope. The same plugins work, but you get a bit more
bandwidth-- up to 200MHz and the fourth slot lets you do some interesting
things with delaying timebases.

For smaller units, I prefer the 475. Nice and solid.

To complement the Tek 3052B digital scopes, I use 7904 with high speed
plugins (like 7A19 and 7B92). The 7904 is the stand for the 3052B.

I use SC502 and SC504 in the TM500 racks when I want to watch something on
the bench without taking up space.

Yes indeed that's is very good purpose if for a spectrum analyser

A long time ago I purchased (in the UK) a spectrum probe useful between
LF and 90 MHz meant for EMC testing in conjunction with a (if you wish
as low as 1 MHz) oscilloscope. I find it a very useful instrument for
homebrewing HF equipment ,although it is of course not a complete
spectrum analyser .

With an emergency (assuming no electricity) you can forget about
"charging it". What you want to do is generate it in my opinion.

Now in my mid 50's, I am reminded of something my father said. He had always said, that ever since 1957 , he wanted a Cadillac. In the later years of his life, hefinally got his wish - he bought a 1957 Cadillac.

For years I have been collecting and restoring the iconic untouchables of my early days in Engineering. Scopes are like boats, you can never have too many. But they are useful. My particular weakness has been the HP 141T family of Spectrum Analyzers. What was 20K + then, is now cheap. Winter nights are spent re-Cap-ing, calibrating, and restoring these remnants of the last great Analog Spectrum Analyzer.

Like restoring the automobiles of one's youth, these are tangible links to our own past. Any good tool, kept in working condition is valuable. To see these Cadillacs of the past brought back to their former glory is reward enough.

As John said so well, Oh what a feeling!

Thanks for the leads so far....

Has anyone actually built any of this designs and hooked it to a
laptop?

If so, I would love to hear about it...links and pictures would be
great.

If you look, you will find very few sites talking about actual efforts.

The carbon/iron/saltwater cell is a "primary" cell - and not
rechargeable.

1. As others have said, when you need to fix your other scope. My 465
just took a dump a couple weeks ago. Used the 475 to troubleshoot it.
One of the HV ceramic caps has excess leakage :(At least it's a
replaceable part.

2. It's also nice to have a spare when the other scope goes down.

3. Sometimes you just need two scopes to do the job, especially when
your project is divided up between two racks of equipment.

4. Sometimes you need multiple scopes because your events are
asynchronous.

5. Some scopes are better at doing certain tasks like those nifty
microchannel plate intensified scopes.

6. Sometimes you have multiple projects going and it's nice not having
to disassemble your test setup.

7. You may have a 7000 mainframe, but need a portable scope like the
465.

8. It's also nice to have a modern digital scope for slow events, math
functions, and documentation. But, keep those analog scopes around as
they convey more information about the signal at a glance than any
digital scope I've used.

You also mentioned something about spectrum analyzers. Extremely handy for certain types of work. Depending on the anlyzer, they are great for characterizing filters, amplifiers, noise in low-level amplifiers, EMI issues, unwanted oscillations, impedance, and a host of other things.

Mark

We had a dozen citrus trees in the back yard till recently (citrus canker eradication program... the state cut em all down). I wondered about building 'citric acid' electrolye batteries as I picked up garbage cans full of oranges and grapfruit.

I wonder if the costs are in the acid or the electrode
materials though?

Some batteries are just lemons when they first come
out.

Vanessa Redgrave, Conchita Llach, Carla Ross-Robertson are in line with Mr. Landsberg (Maltese Falcon.)

Conchita Llach: LLach Jewelers, Miami, FL, frequent trips to Guatemala, home (coffee plantations) in San Salvador, El Salvador, father liaison to the Vatican for El Salvador (or for San Salvador, El Salvador.)

Carla Ross-Robertson married to British Intelligence (Jim Robertson.) They perfect mind control techniques using handicapped children in the state of Virginia.

These people supervised the torture of 800,000,000 infants to end God.

The United States, satanic, has been in communication/trade with the Dog Star System, the Plieades, Saturn, Pluto, Mercury and Venus (and possibly just outside the Milky Way.)

Bonnie, from Mercury, supervises mind control for that world.

John (former Apostle) supervises mind control for Venus. He has worked with actor Bill Murray (DOD, civilian military) on a virtual reality program, "the ritual abuse experience."

Michael, former Archangel, is in contact with the Saturnians.

Does anyone remember the "Jetronics" knockoffs of the Tektronix
'scopes?

When I was going to Army radar school in 1966 / 67, We used a Jetronics
545A (I think that's right).

The Jet was fine for school. Triggered sweep and good to at least 30
Mhz. Before I was drafted, all I had at home was a Simpson
"Handiscope". Rated to 100 Khz, but would see a 262 kc. IF signal.

It's comforting to know that once I was assigned permanent duty at an
Army missile site, all we used were Tektronix and Hickok 'scopes.

John

Hi

Caig has DeOxit in 5% and 100% formula,
the 5% works most of the time.
You can get it in standard aerosol (hazmat ship fee ups)
or the pump can D5P (no hazmat fees)
www.caig.com

www.mcmelectronics.com has it in stock

Certainly true, although my feeling is that 'ugly' construction above a ground plane creates _well controlled_ parasitics that tend not to change much based on, e.g., waving your hand above the PCB, mounting the PCB close to a metal chassis, etc.

OK, one more question, do you need the RS-232 port if you only want to lock a vcxo to the 10kHz? My guess is no, just +5 volts and ground, and take the 10kHz from pin 20 of the connector.

No you don't need to concern yourself with the data port (*)(**) for a frequency reference. Just make sure you have the appropriate 0v/5v on the appropriate lines as per the data sheet to get the bootup mode correct.

* Without parsing the $GPRMC sentence you can't tell if you have a valid fix. And that is the ONLY sure way to know your 10kHz is actually locked to the sat source(s) and not derived from the rx oscillator free-running. It's pity one of those N/C pins doesn't have a "valid" flag on it - would save the need for a downstream processor.

** I presume you are (also) talking Rockwell/Conexant Jupiter board.

I have used the older Rockwell GPS stuff and they seem to need to have a recent almanac transferred to them before they will get a fix. Rockwell used to distribute a freebie software package that would help you deal with all the setup stuff. It was called something like Lab_10 or Lab_X or somesuch. The newer stuff may need less handholding.

Good Luck,
Bob

My experience is that the most common and troublesome parasitic
reactance in modern solid-state circuitry is, by far, the inductance of
the ground system. And that's just where "ugly" construction shines --
it makes that inductance as small as possible.

Roy Lewallen, W7EL

I own some scopes. Though, my favorite is not one of Tek ones,
but HP-1741A storage scope.
Anyway, I realized that when I troubleshoot my scopes or fix
something with them, I always got extra screws left.
It is a bit annoying experience because I know those extra screw
were being used somewhere.
I think that test equipment are made of way too many extra screws.

> Two years shy of forty years of age and the scope still
> works. Bloody marvellous!

It's probably a matter of total operating time instead of
how old it is. I heard a story from an old analog engineer
saying that when storage scopes were new, they were
SO EXPENSIVE that you just couldn't keep them turned on,
but only when you need to take a vital measurement you were
allowed to turn it on.
If that is true, I think some old storage scopes are actually
bargains instead of to-be-avoied.

Switches in that environment
> of damp and dust can't be expected to remain clean and

> as it does even with its dodgy switch.

I owned one 454, and later used one 454A. The 454 seemed to
comsume much more power than 454A. In winter, having the 454
closer was nice.

You might like to have a look at the Silicaon Chip website - they published a weather station not so long ago - I read the articale at the library so don't have a copy, but a search of their site should find it - the windspeed/direction part looks very neat and should be reliable and cheap

I tend to use PCBs, but I make them single-sided on double-sided PCB
stock, so that there is a continous ground plane on the top.

Hi Paul,

That sort of "mini-L" packaging is often used for vhf components, e.g. tuning diodes, hot carrier diodes and PIN diodes - and some of these have forward volt-drops of more than one volt.

You can investigate that suggestion that it is a high-voltage rectifier by applying, say, 200v reverse voltage via a 1Mohm resistor and measuring the breakdown (if any) voltage of the diode, or what current flows. Any of the other suggestions - including mine - will break down.

Are there definitely no markings?

That's an interesting observation, Bob. I was watching the NMEA output from
power-up on the Jupiter I am using doing a "frozen start" out of the box without
an antenna. One sentence showed it checking each sat in turn. When it finds
one (which it obviously doesn't do with no ant) it assigns a Rx channel# to it.

When I finished play mode on the pooter end and connected an ant, it went
through each bird in turn, about one per second. So within a minute it had
acquired a set of birds and began processing. As I am using no form of backup,
the Jupiter starts from ROM each time and does a similar "frozen start" i,e,
factory almanac). It consistently achieves a full fix in under 3 minutes.

Just how high is that horse of yours?

I am neither a dealer or a hamfest tire kicker. I am a collector of sorts. And as a result, I was suckered in by an older Yeasu FT-401 transceiver, "Mint, Restored. I have gone thru this rig and replaced all tubes that needed to replaced, and fitted a new T/R relay."

What I got was a filthy rig in better than average condition, but not mint. The CW filter is non-functioning, the finals were flat(his "new "tubes gave me 10w out on 80m), and the T/R relay is original, not a NOS replacement as he claimed. A bad solder joint in the mixer stage rendered it inoperable until I corrected it.

If you don't think Martin threatens negative feedback, look at his recent feedback to see how many negatives are posted as neutral, or even positve feedbacks. I'm on his "blocked bidders list" because I posted my complaints as negatives, and I can live with that. Ebay would be a safer place if everyone posted negatives that were deserved.

Hmmm? I cannot imagine what you like about the 1741A, but different
strokes for different folks.

Be very careful with that grey horizontal timing switch knob. HP cut two
(or was it 3?) slots that each cover 175 (115?) degrees through the body of the knob.
They did that so that you could see the light mounted on the panel through
the knob. Well, when the switch's lubrication gets a little sticky,
and you get a little enthusiastic (and lord knows the plastic is already
at least 18 years old), you will snap those thin little bits of plastic,
and your knob will be gone, and your scope will be unusable. Forget about
gluing it, as there was barely enough strength with the virgin plastic.

We had dozens of that family of HP scope, and they all went into scrap because
the knobs were unavailable.

Tektronix did the same thing with their horizontal knobs, but they
knew enough about materials engineering to make the body of the knob
out of aluminum, and make the grip surface of the knob out of plastic.

Still using the 275Mhz hp1726A that was given to me when I started working
for HP in '83.
I keep it covered when not being used, so it still looks like new. Perhaps
some day it will crap out, and I'll try a Tek!!

148. Building a DAB radio

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-05 20:03:57 UTC
From: Mike <fakemail@hotmail.com>
Message-ID: <NYevf.19591$r4.2009@newsfe1-gui.ntli.net>
Source record: 14799

Hello,
has anyone come across any projects or info on building your own DAB radio.

This is my (limited) understanding:

How it's sent: The audio (or whatever) signal is split and sent using Quadrature Amplitude Modulation over many narrow band carriers (each carrier at a different frequency): Ie it's spread spectrum. Error correction Coding is also used, etc.
To decode it: This is where I'm confused; Can I build a receiver which will receive the whole collection of narrow band carriers, then feed it into a computer that will do some FFT?

Not really sure how to move forward; any ideas would be fantastic.

Thankyou all!

(PS It's good to see there's a newsgroup on this topic).

Yes, that's usually how it's done. The approach I've seen is to grab
the whole slice of the RF section, downconvert to a convenient IF (via
superhet or direct conversion), then feed the whole signal into
something which can use DSP to detect and demodulate the individual
carriers.

A common approach for Digital Radio Mondiale broadcasting (which has a
relatively narrow RF bandwidth) is to use a single-sideband receiver
architecture of some sort, downconverting the DRM signal from RF to a
same-width slice of audio spectrum, then feed it into a PC via the
PC's sound card, and doing the DSP work using the PC's CPU.

The commercial high-fidelity DAB systems used in the US may very well
have a bandwidth too wide to allow this simple approach to be used (I
haven't studied them in any detail) but the same basic principles
would apply. Block-convert the RF range you want to an
easily-captured IF range, do an A-to-D on it, and do the rest of the
processing digitally in a CPU or dedicated DSP chip.

Take a look at http://www.gnu.org/software/gnuradio/ for a look at
some open-source software-radio techniques.

I haven't seen that reliability is a problem with the 1726A. They go and go... Drift is a bad problem, the zero goes all over the place, and needs constant diddling. It is all but impossible to adjust so that the variable volts/division knob doesn't shift the zero (and have it stay adjusted). The horizontal time knob is a really bad problem, as I discussed in an earlier note. If you haven't taken your scope apart, and oiled that switch's shaft, and replaced the grease on the ball detent, I would strongly suggest that you do so. When the knob breaks, it is end of game. I strongly considered turning out the inside of one of the broken knobs, and making an aluminum version of the center of the knob. The 1726A I wanted to fix was a complete cherry otherwise. But, Tek scopes were so easy to find and so cheap, that I couldn't see any real point. Into the scrap bin it went.

Thanks budgie, I was talking about the Jupiter bd. Another thought was will it work without an antenna? I guess it will. I will be using it outside on hill tops so should not have a problem a set of birds to lock on. I see an output on pin 19 that is mark Epps that may be use to show a lock condition.

This surprised me also. As I mentioned earlier, these two system that
this showed up on were very old, 5 channel receivers.

Sitting outside, with a clear view of the sky, the receivers would
search through one sat at a time and find one occasionally, but they
would lose them after several minutes. After a couple of hours, they had
not acquired and held enough SV's to get a fix at any time.

I loaded up an almanac through the tool and either receiver would get a
fix within a few minutes and hold it for the half hour that I left them
to run.

I am assuming that these receivers were running out of ROM as well. Some
GPS systems put an almanac in ROM to improve the cold start fix time,
but I don't know if these are among them.

As for the original poster's other question about needing an antenna, I would say that unless there is one on the Jupiter board, then yes.

Bob

Mine has 1pps (one pulse per second, time mark) on pin 19. "Epps" sounds
excitingly similar.

The one I have is: www.gpskit.nl/documents/rockwell/jupiter_v230.pdf
which shows pin assignments and gives fairly good guff on the ROM-based start.

We obviously have different receivers. Mine is a 12-channel unit.

www.gpskit.nl/documents/rockwell/jupiter_v230.pdf

>Sitting outside, with a clear view of the sky, the receivers would

>not acquired and held enough SV's to get a fix at any time.

With a "sufficient" antenna (I am using a 27dB patch) mine doesn't lose any SV's
unless they drop below the elevation mask. Once it has one, you keep seeing it
in the sentence.

>I loaded up an almanac through the tool and either receiver would get a

Mine certainly is, but with the 3 minute TTFF from obsolete ROM it's fine for my time/frequency purposes.

>As for the original poster's other question about needing an antenna, I
>would say that unless there is one on the Jupiter board, then yes.

Confirmed. I tried a number of improvised passive antennae on my workbench (where I get good fixes with a Garmin II+ on its standard antenna) and it never found a single SV. Never tried outdoors ona passive, went straight to an active patch on the windowsill ;-)

That's a good idea! I think DRM has more potential than DAB at least
from a technical standpoint, as it will go further (less retransmission,
less power needed). But I'm not really an expert.

(Sorry, I should have mentioned that I'm in the UK).
I've just found a bbc 'paper' linked to from wikipedia, but now
hosted on web.archive.org at:

http://web.archive.org/web/20040401020811/http%3A//www.bbc.co.uk/rd/pubs/papers/paper_21/paper_21.html
that says a DAB station would occupy up to 1.54MHz of the spectrum,
with the individual carriers spaced 1kHz apart.
I was hoping a PIC might be able to decode it. Most seem to be able to
manage 40MHz, which might not be fast enough... although a pair of them
sharing the task (one getting the raw 1s and 0s, the other doing stuff
with them) might work.

> Take a look at http://www.gnu.org/software/gnuradio/ for a look at
> some open-source software-radio techniques.

Thanks for the hints and advice,
this is the first time I've used a public newsgroup for years
and I'm pleased by a) how helpful it's been and b) that it's still
alive and well. I'll try to help someone else in return.

Thanks Dave! (Your reply's really been helpful!!)

Good question....in the original posting I mention communications
equipment.

It is assuming that Robinson Crusoe wants to be rescued.

The discussion has demonstrated to me how we tend to underestimate how
hard it is to provide basic needs to support our technology based life.

Maybe we should enlarge the scope of the problem and allow active power
generation.

Any ideas as to how to generate power?

I've had a 545 (military version), and it was quite good, although it had some calibration issues that I never really got resolved. Most of the time, though, I just used my 475, up until a couple of years ago.

I got rid of the 454 (space reasons), and picked up an HP 54201D digital scope with logic analyzer-type triggering. Although I haven't needed the fancy triggering yet (though it would have been really helpful a couple of times in the past), the scope itself has now become my main scope.

It's good to 300MHz (though I rarely need anything that fast), and I find I'm using the on-screen measurement capabilities and storage abilities quite a lot. Of course, the 475 is still sitting right on top, and in fact I used it to fix a faulty input channel in the 54201D when I first bought it. But really, the 475 rarely gets turned on now.

Oh - the best part was that the 54201D only cost me $50 at a Ham swap meet...

Oh, and servicing the HP 54201D scope was pretty easy. It came apart in obvious ways, and the boards were big, double-sided (not multi-layer), and gold plated. There were a couple of scary-looking custom IC's, but the problem in my case was just a burned-up 100 ohm resistor.

I eventually bought (rented and copied, actually) the operator and service manuals for it, from W J Ford, who were quite easy to deal with and had a *really* large stock of old manuals.

Scrap? Surely a machinist could make a suitable replacement knob for
less than the value of a good scope.

> lionfish _A_T_ uwcs.co.uk

What you need to do is well beyond the capabilities of even a 40MHz PIC.

You need to sample the data at a good bit over 2x 1.54MHz -- somewhere
between 2.5x and 3x would probably be good, depending on what kind of a
tradeoff you wanted to make between front-end filters and ADC sample
rate. Once you've done that you need to synchronize to the data and do
a 2048-point FFT 1000 times a second. That's going to take on the order
of 40 million multiplies per second -- and there's no way a PIC is going
to be able to do one multiply per clock cycle.

You _might_ be able to do this with a good fast DSP chip -- expect to
need one that clocks at over 100MHz. You could also do this with a
fairly modest FPGA, which may be the best way to do it from a technical
standpoint for a short production run or prototype, but which may be a
bit difficult for a hobbyist -- although once you were done you'd be
ready to go into consulting.

Mike,

Look at the converter boards suitable for GnuRadio (DRM). They use fast chips from Analog Devices and you can see the whole design and schematics.

This will give you a good hint on what's needed. Remember that darned Mr Nyquist! You really need the speed!

A good way forward while building the conversion block is to initially use GnuRadio for verification before you start coding with a PIC.

Cheers

Dan

You obviously haven't hired a machinist lately. In pristine shape, the
scopes were worth $75 tops, the machine shops charge $100/hour, 1 hour
minimum.

I was going to do the job myself, but balked because even when I was done,
all I would have was a bunch of scopes that no one wanted to buy. We had
them (with the broken/missing knobs in the $15 pile at several hamfests,
and they went nowhere.

The problem needs better definition. May we assume Robinson has been
able to recover large rolls of wire, etc., from his ship, or does he
have to mine the ore, smelt it, make the appropriate dies, pull the
wire, ... (lotsa dots!), or may we assume he has EVERYTHING
EXCEPT a generator (i.e., his island once held a thriving modern-type
civilization but all of its generators have rusted?

DRM uses a significantly lower bandwidth than the spec the OP linked to.
In fact, you can implement a DRM demodulator in software on a PC. I
wouldn't take anything that works with DRM as an indicator for what

hardware you'd need for the DAB format he's interested in.

May be relevant. When a plastic eyepiece on my father's WW I binoculars
shattered I found a company that made an exact copy from the other
eyepiece which I sent them. This was some twenty five years ago.

I don't know what the plastic was, possibly some form of Bakelite or
Ebonite.

I understand your comments but I am trying to not to define the problem in detail. The object of the discussion is to facillate discussion about what a survivor would have to consider, need and build to get power to operate the comm set and hopefully initiate rescue operations.

If one consider poor Crusoe's plight, he is stranded on an island that he doesn't know what is available...he has to find and use what is available. I was hoping the group would speculate on what he might have available. Part of the intent is to consider what the minimum would be needed to pull this off.

I did mention that he had comm gear that would use a 12 volt battery....so I am assuming that parts of his boat/plane washed up on the shore of the island. The battery could just as well power a island built spark generator, a light bulb for night signaling, ignite fires or homemade explosives....again, remember this poor guy is trying to attract attention to his plight.

How about some more wild ideas...Crusoe is getting sick of eating coconuts. ;<)

Robinson 'could'--with nothing more than the battery and some
wire--transmit radio signals in Morse....

No accounting for range, of course.

True...but this just shows how important the battery really is...and
that is why I chose to make it the main focus of Crusoe's efforts to
get attention.

Every now and then, one lucks out on a HP scope. For the most part, the HP
scopes I've used have been pretty marginal. There was one that was an
absolute nightmare, but that was a special case, because it was military,
and <oh, shit, apologies in advance> it was in a special case. <rimshot>
The knobs all had little waterproof rubber skirts, which had backlash that
makes ordinary backlash look like nothing at all. You had to go _WAY_ past
the setting you wanted, and hope that when the knob sprang back it would
land on the setting. I remarked to a coworker: "It probably wouldn't even
be a good boat anchor, because it would float."

I _did_ once use an HP that was tolerable.

But If I'm the one who signs the check,
my first choice, of course, would be a Tek. :-)

Cheers!
Rich

No, they became short of CRT's because of their success in
network analyzer business, perhaps.

It seems that more people are having trouble with HP scopes
than I thought.
One has to treat scopes gently, just like treating women's body.
Instead of "pushing" buttons, one has to "touch" them.

Atsunori

Look around,You might find some "litter" for the cells..old tin cans,rods,bars,nuts+bolts,fish hooks,whatever.. Maybe you'd get lucky and find a wrecked(,or parts of a) boat or plane,or get really lucky and find parts from the boat/planes electrical gizmos to play with.

Maybe wire up some lights,or a simple (spark gap) transmitter,and send out an SOS.Dunno if anyone would see the lights,or what you'd use for an antenna...anything you can find,I guess.

Or just touch the eels together,Spark-gap and arc-light all on one!

That's just it, they all had the main knob broken. Some had the pieces intact,
but broken, others had nothing.

All worked, and all had the usual HP problems with drifty vertical amplifiers,
and easy to fool triggers. It wasn't worth fixing them. We also had dozens,
upon dozens of tek 465, 475, 485...

The tek scopes flew out, regardless of condition, the HP's just sat.

Long ago I was given a summer job to repair a palletload of HP 1xx scopes. One had a bad power transformer, unobtainable. The rest just needed new power supply filter capacitors. They seemed like nice scope, within their limits. Not particularly fast or bright or DC stable, but okay for our biomedical lab. I think that one had an actual knob on the DC balance control, it was so shaky.

I know this sounds like faint praise, but there's just something about a scope without a fan, with nice big knobs that go click instead of clunk, and that need no bandwidth limit button to keep the FM-ROCk-101 from fuzzing up the trace.

The HP 175 was an impressive scope-- 50+ 6DJ8's, 50MHz bandwidth, and a super bright CRT. It just ran and ran up until 1995 when the TRANSISTORS in the power supply went bad.

Still use a Tek 475 as my main bench scope.

Have tried several 54xxx digital scopes, don't care for the yucky green or amber screens, or the infuriating menu structure, or the way they don't detect clipping.

I have several Tek 485's on the to-repair shelf. IIRC they have about six power supply voltages and if any one of them gets out of spec the whole thing shuts down. Then it's kinda hard to figure out which one went blooey first. Grrr....

Well no I haven't hired one because friends of mine own a machine shop
so I can get favors like that for free but still, $75 tops? We're
talking a pretty decent scope aren't we? When I bought my Tek 465 a few
years ago I couldn't find anything 100MHz dual trace in working order
for under $275 or so.

194. SolderSmoke #12 -- A Show for Electronics Homebrewers

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-07 07:08:50 UTC
From: bill.meara@gmail.com
Message-ID: <1136617730.514893.106850@g43g2000cwa.googlegroups.com>

SOLDERSMOKE!
A SHOW FOR ELECTRONICS HOMEBREWERS!
http://www.ourmedia.org/node/128175

Topics discussed in SolderSmoke 12:
-- Using spreadsheet software to design simple amplifiers.
-- Building an amp for the DDS VFO.
-- A cold solder joint detector.
-- DC to DC converter to power Elecraft rig.
-- Beagle 2 Mars Mission: crash site found?
-- Dobsonian telescopes and London sidewalk astronomy.

Listen at: http://www.ourmedia.org/node/128175

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.

http://www.ourmedia.org/mediarss/user/36170

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/node/128175

We hope you enjoy the program. Please send us feedback.

73 from London
Bill M0HBR N2CQR CU2JL

What is Ham Radio?

(Preface)
It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery. Even
the Usenet newsgroups dedicated to the cause have degenerated
into a hotbed of abusive onslaughts by those who ought to know better.
However, there still exists the fundamental basis on which Ham
Radio is based, and that will never die. This FAQ ("What Is
Ham Radio?") will be regularly published and will not be
shouted or bullied down. It is important that those of a
technical bent, who are the natural seed-corn of Radio Hammery
and who gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_
to you to exert yourselves to join our fraternity! (If you find
otherwise, then perhaps you are already classing yourself in the
mediocre groups of those who are criticised in the FAQ and from
whom we _MUST_ dissociate? If so - it's never too late for
a re-taxonomisation on your part - there's nothing elitist about
us, and we welcome all those who are prepared to put themselves
out in order to join our ranks!)

-----ooooo-----
(Article)
So,.....What is Ham Radio?

Ham Radio is a technical pursuit for those who
are interested in the science of radio wave
propagation and who are also interested in the
way that their radios function. It has a long-standing
tradition of providing a source of engineers who
are born naturals.

Ham Radio awakens in its aficionados a whole-life
fascination with all things technical and gives
an all-abiding curiosity to improve one's scientific
knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience
with ones fellow man, and shows itself in the
gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that
they can construct and operate their own equipment! No-one
else has this privilege. Users, such as broadcasters,
the po lice and armed farces, CBers and mobile phone
users have to purchase ready-made gear. Manufacturers
are not licensed to operate their gear. Radio Hams
are qualified to design, build and then
operate their own pieces of equipment. They do this
with gusto, and also repair and modify their own
equipment. This is a privilege well worth the effort
to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with
relatively simple technologies at first, perhaps making
his own Wimshurst machine and primary cells. Small pieces
of test equipment follow, possibly multimeters and signal
generators. Then comes receivers and transmitters. It is with
the latter that communication with like-minded technically
motivated people takes off. The scope for technical
development grows with the years
and now encompasses DSP and DDS. There is also a great deal
of excitement in the areas of computer programming to
be learnt and applied.

The technical excitement motivates Radio Hams to compete
with each other to determine who has designed and manufactured
the best-quality station. This competitiveness is found in DXing,
competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a
desirable thing to have that there are large
numbers of people who wish to be thought of
as Radio Hams when, in fact, they are nothing
of the kind! Usually such people are a
variation of the CB Radio hobbyist; they buy their
radios off the shelf and send them back to be
repaired; they are not interested in technical discussion
and sneer at those who are; they have no idea how
their radios work inside and have no wish to find out;
they are free with rather silly personal insults;
they have not satisfied any technical qualification
and their licences prevent the use of
self-designed-and-built equipment.

These CB types engage in the competitive activities
with their Cheque-Book-purchased off-the-shelf radios
in a forlorn effort to prove that they are Radio Hams.

No _REAL_ Radio Hams are deceived by such people!

-----ooooo-----

One such CB type is the so-called "Not-Ham". Otherwise
known as the CBer-Masquerading-As-A-Radio-Ham, this type
had their background in the hobby that is CB Radio and not
in the technical pursuits that lead up to a coveted Ham licence.
Easily recognised by their boasts of the criminal activity of
11 metre SSB operation, one wonders why they don't go back to
the CB Bands if such bands are dearer in their hearts than are the Ham
Bands? No _REAL Radio Hams associate with those who made an
illegal installation of transmitting equipment before being
in possession of an appropriate licence.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist
from the _REAL_ Radio Ham is to solicit their view of the
difference between CB Radio and Ham Radio. A Radio Ham will
perceive Ham Radio to be a technical pursuit and will
perceive CB Radio to be a social communications facility
no different in essence to a land-line telephone or a
GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
could also hold a CB licence safe in the knowledge that
such a licence says no more about him than having a land-line
telephone, whilst continuing to regard Ham Radio as a separate
technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between
a Ham Radio licence and a CB Radio licence. To him, they are
sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then
tries to classify himself as the equal of the Radio
Ham when, in fact, he is nothing of the kind. A sure sign of
a CB Radio hobbyist is if he holds, or has ever held, a licence
issued under the gangrenous degeneration that is the
M3/CB Fools' Licence scheme.

-----ooooo-----

One group of people who claim to be of the standard of
Radio Hams but who are in reality nothing more than an
apology for the failure of a CBer are those class B
licensees who falsely proclaimed that they were against
the use of a Morse Test to control access to the HF
bands, until, that is, a test was introduced at their
intellectual level, the intellectual level of 6-year-olds.

6 year-olds simply lack the mathematical tool kit to
enable them to handle even the simplest algebraic manipulation
for Ohm's Law and thus, the disgraceful Class Ber's in
the aforementioned category are not Radio Hams by any stretch
of the imagination!

Remember - A sure sign of a CB Radio hobbyist is if he holds,
or has ever held, a licence issued under the gangrenous
degeneration that is the M3/CB Fools' Licence scheme!

197. SPRAT 125 - G-QRP Journal - Winter 2005/6

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-07 08:29:18 UTC
From: Orator For Decency <radio.ham@lycos.co.uk>
Message-ID: <1136622558.244000.49370@g49g2000cwa.googlegroups.com>
Source record: 14745
Cross-posted to: uk.radio.amateur,rec.radio.amateur.homebrew

Arrived in the popst this morning, suggesting that we _DO_
have a national society for _REAL_ Radio Hams in the UK, and
that is the G-QRP club!
Qucikly browsing.....

"Poundshop DC Radio" - converting one of those cheapo scanning
VHF FM Radios into a DC RX for HF.

A 10W AM Top Band Rig - here I criticise the G-QRP club for not
only supporting the gangrenous degeneration that is the M3/CB
Fools' Licence scheme, but also encouraging those who are
licensees thereto to break the terms of their licence - the author
is an M3/CB Fools' Licence and the type of rig is not licensable.

Making leads for the FT817 - well, if the G-QRP club are falling into
the same trap as the RSCB and trying to recruit new members
from anywhare, then articles on CB accessories are an inevitable
result.

Making plug-in coils - but using DIN plugs and not the B9A
favoured by Denco!

78xx regulator circuits

A 2m 10mW AM handheld - odd that his should publ;icise Hans
Summers because his history of Childish Broadcasts (CB) in
this NG directed at me would suggest that his interests lie elsewhere.

RF powered sidetone

Use of a Biro case as a solder dispenser.

HF Antenna for a small garden

All-in-all, a good Ham Radio mag, save for the contributions
from CB types.

Does anyone happen to know the jumpers to set in the transmitter to make the FX5000 accept an external frequency input?

I would like to run the transmitter from an external 1mhz reference (I believe that's the frequency it needs?)

Ta,

sam

Walt, Meet Mark "Markie" Morgan, KB9RQZ. Markie is a functionally illiterate, socially inept, welfare dependent, sexually deviant alcoholic miscreant of American society.

Markie claims to have an IQ of 248. For reasons I am sure you can see, we seriously doubt his honesty (although he gives us dozen of other reasons to do that).

Markie has in the past tried to regale us with his alleged skill and knowledge of all-things-computing, but can't seem to get a spell checker to work.

Go figure.

His latest demonstration of skill is to bomb the NG with over 700 posts in an attempt to harrass me. All it's done is solidify everyone else's opinion on his mental instability. Witness his taglines that have my home address but someone else's phone number. (Oh, by the way...Markie likes to make up screen names of dead children and use them in order to circumvent Google posting limits...)

So...there you go. On behalf of American Amateurs everywhere, I extend my apologies to those of you "across the pond" who ahve to see this creep's foul mouth and childish rantings in this forum.

202. SPRAT #125 - The Saviour of Ham Radio?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-07 11:55:00 UTC
From: Orator For Decency <aiyr.r.bean@lycos.co.uk>
Message-ID: <1136634900.634706.200590@z14g2000cwz.googlegroups.com>
Source record: 14747
Cross-posted to: uk.radio.amateur,rec.radio.amateur.homebrew

The Winter 2005/6 edition of SPRAT would seem to indicate that
the G-QRP club is well placed to act as the guardian of _REAL_
Ham Radio in Britland, now that the RSCB has thrown in the
towel by the metaphorically-mixing act of nailing its colours
("colors" for the non-English-speaking Yanks) to the mast.

A bevy of practical articles, including a suggestion for using
a throw-away VHF FM scanner RX as an HF RX.

One point of criticism, to keep a balance, is that the G-QRP
club supports the gangrenous degeneration that is the M3/CB
Fools' Licence scheme and by publishing a homebrew Top
Band rig by a licensee in the aforementioned scheme is encouraging
the licensees thereof to breach their licence conditions.

Back in the '60s and early '70s I did some work with Impatt and Gunn diodes, building a little self-detecting doppler for speed sensing. However, 35 years have passed and my notebooks for that stuff are somewhere in a dusty archive along with my venerable sliderule.

Is there a cheap source for onesies-twosies of a radar front-end that will give me doppler audio as a function of a large metal object's speed at a range of 20 meters or so? I don't need to go into production on this thing, just build one. A surplus source would be ideal.

It seems that the little kids on our rural country lane have all become teenagers at once and are trying to outdo the others in how fast they can drive daddy's car up and down the lane. We've lost one dog this week and unless I can put up some sort of a siren that goes off when they exceed some agreed upon limit, the carnage will continue.

Regards,

Jim

Yep they are available. I have about a dozen or so of Gunn units that
came from
10 GHz door opening bits They have the Gunn diode and a detector diode.
The rest of the
electronics I threw away.

Two of them can be sent for the cost of postage.

I realize this is way off the subject, and I do honestly wish you
success in getting the neighborhood speed demons under control, but...

as a bicyclist, I find it necessary to point out... that if the
neighborhood dogs are being hit by speeders, those dogs are obviously in
the road. They shouldn't be.

Neither should little kids, but poo happens. With dogs it's "I'm sorry".
With kids it's manslaughter.

IIRC I've seen police radar guns as surplus.

It's been quite a few years ago now, so I don't recall the details,
but I bought a "sports gun" for my youngest that he used at dragster
events. I think it was about $100.

Do a looksie on E-Pay, cheap old style X and K band units are available. With a 12vDC power supply, you can have your very own source. Even if you just buy the head without the counter, the 12vdc will supply the head and it will put out.

Do NOT purchase the Ramsey "kit" for this applicaiton. While it may be fun for a budding electronics wanna-be, it does not put out at a frequency that will trigger radar detectors.

Jack

Jim, take a look at www.shfmicro.com where you'll find 10GHz and
24GHz doppler modules for sale at very favourable prices. They would
certainly be very useful for what you have in mind.

Good luck..

Hello Jim,

> Neither should little kids, but poo happens. With dogs it's "I'm sorry". ...

Not necessarily. It can become wrongful death but you'd have to have
proof of grossly excessive speed. Skidmarks can be such proof if a car
doesn't have ALB. But, of course, the experts for that usually only come
out when a person has been hit.

He's not trying to set off detectors, he's trying to set a speed
threshold where a siren goes off.

But what the heck, if you're going to set up an illegal transmitter,
might as well use one big enough to reset the ECM in their cars.

Go to your local police department and have them monitor the speeders with a
automated speed display unit. What! they don't have one in your town? bring it
up at the next town meeting... ;)

Why? Don't you intend to trigger a siren to slow them down? What's it matter
if they slow down because of their dectors - they slow down, and that would
appear to be the important thing.

Cheers.

What a waste of time! If you have a problem with speeding cars just phone
the police, or video record it and phone them at a later date. Also don't
be irresponsible and let dogs out as they might cause an accident or get
killed if they run across roads infront of cars.

RESPONSIBLE parents do not let their children run out in the road, idiots
that allow dogs to run free in the road need to be aware that they can cause
accidents. I do hope the pathetic owner is held responsible when a dog
which is out of control runs out and causes an accident.
Two seperate arguments, you need to be clear of what it is you want.
Jealousy is a terrible thing, so if that's all it's down to then give up.
That is wht it comes across as. The people concerned probably have their
own cars and don't expect some idiot to allow a dog to run infront of them
in the hope they will hit it. Were you after an insurance claim?
Keep the dogs under control as responsible people keep their children under
control.

No idea what you mean by ALB as abbreviations are only good for those who
all have an understanding of what is meant.
If you refer to a car with antilock brakes then they DO leave marks that can
be identified. I have investigated enough accident scenes that leave the
same tell tale signs. Boy racers with antilock brakes all assume they can
go faster and no one will know. How wrong they are.

I used ALB because it was on the insurance papers. They give a discount
for that feature. In Europe they mostly call it ABS.

True, they do leave regulation patterns. But an accident investigator
told me they are pretty faint and wear off faster by traffic.

Even then it can still happen and we all have to use our cars carefully.
One kid didn't get injured because I was going 15mph in a 25mph zone
(the street where we live). It dashed out when the garage was opened,
zooming into the road from behind a van. Couldn't see it coming but I
never go faster on that street, for that very reason. I came to a stop
about one foot before the child.

What frequency do you want it to count up to and what accuracy?

A recent QST made reference to wireless telegraphic experiments that
didn't involve the use of any batteries at all. The transmitter was a
length of wire cut to 1/4 wavelength and suspended by a tree or a kite.
The feed end was linked to ground through a key.

An antenna of any length is likely to accumulate a charge from
electrostatic field present in the atmosphere...200 volts/meter if I
remember correctly. Keying that charge to ground produces oscillations
that supposedly could be picked up many miles away....probably even
farther now with modern receivers.

What a fu**ing jerk. I asked a technical question in a technical newsgroup. I expect a technical answer.

As to your political and ethical questions to my question, go find another newsgroup to tell others how to live. Our little tiny community knows how to do it, we all agree on the problem, and we're going to solve it. I'm providing the technical know-how.

And don't tell me how to use local law enforcement or local political action how to do it. I've spent 12 years of my life in local elective office at the highest local levels. I don't need your unsolicited advice on how to work the system.

Please, no more of this crap. Anybody with a source for doppler radars, please post. Others, BUTT OUT.

Google Francesco ... I'm pretty sure he has that code on his website still. There must be a hundred variants, all pretty much the same. Weeder is another popular one. I personally like the OM3CPH version. I can probably email you a half-dozen. Most of the 16F84 ones are pretty bad from a code point, making it hard to incorporate your IF, but they all pretty much work.

Unless you have a basketfull of F84's laying around, almost any other part is a better choice. A lot of people use the 628 these days, which is about twice an F84 at a third the price. It usually isn't real tough to make the code changes. (A lot of F84 code, though, it so bad it is hard to make any changes).

If the email on your posting is correct, I'll email you a few.

Hi Jim,

I don't know if I'm going to be graciously asked to butt out, but what
do you expect to gain by an alarm that goes off when presumably some
pre-set speed is exceeded? I do know that when I was a teenager, I would
have viewed such a thing as an almost irresistible attractant.

If you want a radar-based device, get an old police radar gun, and
design an interface to a camera to photograph the licenses of the cars.
Perhaps the parents of these miscreants might enjoy seeing what their
larvae are doing with the family jitney!

Sorry about the dog. 8^(

Thanks for the responses so far....

A few more questions...

How many of you use racks for storing your test equipment?

When you have a choice, do you choose equipment that is rack style or
table top in form factor?

Of the racks used, are they full racks or partial racks with storage?

For storage, what do you use...cabinets, shelves, chests?

What do you for lighting?

Nah, its easy. Find the crashed WW2 B24 in the jungle. Pull out all the radio gear (it would have been "tropic proofed" and so would work - anyway, it was better quality than todays modern plastic junk) - pull a 28 volt generator off one of the engines, and with your Swiss Army Knife carve a propellor to fit it (the original props were wrecked when it crashed) - then, wait for the next windy day, and hit the TX switch. Easy as......

John,
Thanks for the suggestion, I've got a thousand of the things so I have no problems testing one or two to destruction. However it might take a little while to rig up a power supply etc., I will give it a go and get back to the group. No there are no markings at all, not even an indication of a band or dot to mark the cathode. I too thought they looked like a rf package which is why I bought them.

Paul.

Hi, i have aquired an old Dick Smith Radio Direction Finder unit but there is no ASU (Antenna Switching Unit) or antennas with it. I would like to know if someone might have information on how to build the antennas and ASU and any more information on the kit itself.

Thanks

Gary

Could you have found any more newsgroups to cross-post to?

How about a gate at the end of the road that can be opened by the users
with a garage door opener, ie a gated community of sorts. If it's a
private road, keep others off.

they never came with antennas that i know of, you had to build them
yourself. the plans for the asu including circuit board and parts list are
in the manual, they are simple things that you should be able to find at any
radio parts store... assuming you can find one of those today.

Well, I know I'm going to be asked to leave this discussion but,
technically, unless you are IDing with your call sign every 10
minutes. it would be illegal. I seriously doubt that this was in your
plan.

Police radar guns, should you come up with one, are also licensed to
the department, assuming the cops are following the law, always a
dubious proposition.

So, because these are -technical- newsgroups, I was being -technical-.

Now for a "prohibited" non-technical suggestion, here is one that I am
contemplating. I too live on a short, private, single-lane road, that
serves four multi-acre homesites. I am plagued by the guys driving
delivery trucks (DHL, UPS, etc) who roar down the road in a cloud of
dust while delivering to my neighbors. I have complained to UPS
repeatedly without success.

So one of these days, when I'm up to it, after they go by on the way
to the neighbor's house, I'm going to take my truck out and block the
road for 15 minutes. (A second offense will call for a penalty of 30
minutes, etc) UPS seems to have a deal with law enforcement that
exempts them from speed limits on public roads, but in AZ the statutes
say:

28-628. Rights of real property owners

This chapter does not prevent the owner of real property that is used
by the public for purposes of vehicular travel by permission of the
owner and not as a matter of right from:

1. Prohibiting that use.

2. Requiring other, different or additional conditions than those
specified in this chapter.

3. Otherwise regulating the use as deemed best by the owner.

In other words, I get to regulate the speed (I've posted it as 10
MPH). I have no power to fine UPS, but I can still cost them money.

You are not reading the wording carefully; it is the "not as a matter of right from" that you are missing. It very well may be a matter of right if the private road is co-owned by the other property holders and this ownership allows them the right to transact business in the way of receiving deliveries as they choose.

You're probably going to get into "co-ownership" issues regarding the
access easement. How is the road ownership defined... everyone grant
an easement to the others?

A neighbor may sue you for "interference" in his business.

Where in AZ are you?

You should just lay down some pressure switch hose and get a Parallax
BASIC STAMP kit from Radio Shack. Parallax has wireless modules on their
site you can order to xmit the data to your house for timestamping,
archiving via a PC etc...The smarts will run off a 9V for months- you
can't say that about a Gunn osc xmtr or any of the other surplus junk.
And then there is the issue of weather-proofing and possible loss due to
vandalism- think hidden wireless camera activated by intrusion alarm in PIC.

They did come with the needed switching diodes which were a weak point in
the design and there was later a suggested replacement.

Precisely the plan, Wes. The horn serves two purposes. One, it alerts the transgressor that they pushed the button. Two, it alerts me to fire up the truck and block the road.

As others have pointed out, a two pressure hose setup and some simple math in a microprocessor of some sort would serve the same purpose at far less current draw, but I'd like to try the radar gun first.

Hell, Jim Thompson went on for two weeks about how to detect a school bus pulling up in front of the house. I thought this one would go on for at LEAST as long {;-)

BTW, Jim, what was your ultimate solution to that problem?

Jim

Good to see G-QRP are encouraging newcomers to the hobby. Plenty of M3s
listed in the members' handbook, and now writing technical articles for
Sprat too!

I also noticed that G3RJV has re-published the transmitter section of
the SC Deluxe in this month's PW, complete with his usual excellent
explanation of how the circuit works, proving that it doesn't need to
be rocket science.

All of which rather belies the rabid drivel that started this thread!

I've got one - defective - I think I popped the switching diodes by accidentally transmitting thru it. I know I've got the dox 'somewhere' - just gotta dig 'em out.

From memory, the four pin cable from the main unit sends a rotating DC bias to each of the switching diodes in the box. There's a diode at the antenna base too, by design. I haven't opened the box yet, but the diode at the antenna base is ITT BA 282 Cathode (bar) to coax shield.

If/when I find the dox, I'll get back to you. Let me know how you progress.

I suspect any si diode will work to some extent as a varicap or zener.
Not all diodes will be stable as zeners, the 1N506x series will probably
work better as a zeners than the 1n400x series. BTW the 1n5061 will work
as an 850v zener! Also the 1n4007 makes a good poor man's PIN diode for
switching rf.

Well the history channel just showed a 2000 year old battery
found in Bhagdad. It had an iron rod negative pole and a copper
cylinder positive pole, and probably used vinegar as the electrolyte.
A clay jar housed the unit. What would a battery be used for 2000
years ago? BION, electroplating gold!

What's the point? You can make a battery out of many, many substances, but
only a few of them are economical, practical or useful.

I've used them at low VHF, the limiting factor there is minimum
capacitance my be too high for some VHF uses.

>And how about zener diodes?

As varicaps? Some are ok some very poor. You require a breakdown
voltage well above the applied bias.

Allison

Hello Jim,

Since you said this is a road with very little traffic can't you just rig up two IR sensing paths? Like on garage doors? It's unlikely that there'd be two cars passing each other in opposite direction.

Then all you'd need would be a ramp generator that gets started by whichever IR sensor goes first. It is reset by the other sensor. If the reset occurs and the ramp voltage didn't reach a set threshold that means whatever triggered it was going to fast.

Regards, Joerg

I think that the crossbar on the lead marks the cathode. I could be wrong,
of course, in which case it marks the anode.

Gray area. The road is not co-owned by the other property owners. At
least my deed doesn't say a thing about me co-owning a piece of the
property between the public street and me.

Besides, I'm not going to stop the delivery, I'm just going to do some
"traffic calming" when the truch is leaving.

What you're trying to tell me is that I've given up complete control
of an easement and if the truck drivers want to go 100 MPH I have no
say in the matter. If I were to call the Sheriff's office I'd be
told, "It's private property, we can't do a thing." If I asked the
county to grade it I would be told to kiss off. If someone got hurt
on the easement, I would be liable. When I bought the place the title
company had a hissy fit because there wasn't a road maintenance

agreement in place. It took the appraiser writing something to the effect that this was a typical situation in this area, and that each property owner maintained the road on his easement, before the company would issue title insurance.

Sounds to me like I do have some say so over the property.

Thanks Al, but i'm not too good at working out stuff like that, if it's all laid out in kit form i'm ok. and i thought that seeing these things are reasonably critical (antenna units) that if i tried another design i may be waisting my time and parts on something that isn't suited. Thanks for your input.

Thanks for all the responses....

A few more questions....

How many of you use racks to hold your test equipment?

If you do use racks, how do you have your equipment arranged?

Are the racks full length racks or do you have part rack and part
cabinet?

How do you handle parts storage?

How about lighting?

Wes,

Since you have to maintain your portion of the easement, why not build
some "road humps" so the delivery trucks have to slow down or risk
having to resort all the parcels in the back?

Wes...

I'm not a lawyer, nor do I play one on newsgroups. However, having spent a dozen years in the highest public office in this county and sorting this sort of crap out week after week, you have ABSOLUTE control over the easement.

You cannot PROHIBIT transit over the easement, but you can establish "reasonable" controls over passage. A locked gate with "reasonable" access to the keys is OK. A chain that you have to get out of your vehicle to unlock is reasonable. Ten gates with keys may be reasonable or unreasonable, depending on your county judge.

Best wishes, and thanks for your help.

Because road humps expose you to liability for that sort of stuff...like wheel alignments and the like due to the fact that there is no national or regional standard for "road humps". Trust me, I'm in a court case like this right now and nobody can present evidence for the correct design of "road humps".

314. Compensating frequency response of wideband amplifiers

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-09 09:02:01 UTC
From: Joel Kolstad <JKolstad71HatesSpam@yahoo.com>
Message-ID: <11s49mnbl1hmg3e@corp.supernews.com>
Source record: 14560

Could someone point me in the direction of how you might go about flattening the frequency response of a wideband amplifier MMIC? I'm looking at something like the Watkin-Johnson ECG003 (http://www.wj.com/pdf/ECG003.pdf) and noticing that the response drops a little over 2dB from 500MHz to 2.5GHz. Assuming that I've got plenty of SNR, component count isn't a big deal, and I don't mind tweaking trimmers, how might I go about flattening that respone to, say, 0.5dB or better across that range? Or is it just not very practical?

Thanks,
---Joel Kolstad

315. APRSPoint new version available !

APRSPoint 2.2 is released. New features include,

1. Added TNC data view and TNC data log,
2. Enabled auto connect for AGW packet engine,
3. Fixed a bug handling weather station data,
4. Ability to load a default map view at startup,
5. Restore TNC settings when program exits.

and many more. The holiday sale is also extended for 2 more days.
Visist http://www.aprspoint.com for details. Thanks.

Actually, there is a gate at the street. We used to close it at least
at night, although for some reason that slowly ended. It was never
locked, but the sight of it closed stopped a lot of casual traffic
that didn't belong here.

>

There are speed bumps all over this valley on CITY-maintained streets,
as well as speed bumps in many shopping centers.

Since I've not heard of a suit, you might look into Arizona law as to
what's legal and extrapolate to your situation.

BTW, Scottsdale also uses tight-ass round-abouts to slow traffic...
you have to slow or you'll rollover.

Google for "chicane"; that's the generic name for tight wiggle-like
features built into roads and streets to force traffic to slow down.

Google Earth...

Intersection of Cholla St. and 68th St., Scottsdale, AZ 85254

LAT 33.589390ï¿½

LON -111.935610ï¿½

There are quite a few of this type in Scottsdale and in Carefree/Cave
Creek, AZ.

Phoenix tends toward speed bumps, but is also looking into
round-abouts.

Scroll a few blocks SW from there to the NW corner of Desert Cove and
66th St., and you'll see the acre I lived on from 1969 to 1994.

I always referred to the Cholla/68th St. intersection as the "drunk
catcher", because there's a dip there as well... rain drain channel
;-)

How about a gate that opens automatically if approached below a certain
speed, but if approached above it locks closed and will not open until
the vehicle backs up 100 feet and returns slowly.

Our local problem is a street that is normally lightly-travelled, but gets congested during the morning and afternoon because of traffic to/from the high school. The city has proposed widening the whole length (it varies from 50-year-old twisty 2-lane to modern 6-lane boulevard over the stretch in question) and a local group has proposed traffic circles at 4 critical interrsections.

Why not just use a varactor... as a varactor... LOL
They are available in small quanities at www.mouser.com searchword
"varactor"...

Why would you need specs like that? You don't ordinary rely on an
amplifier to provide that kind of flatness. You need a detector and a
PIN modulator in a closed loop.

Since Phillips bought up Signetics, it makes sense they would keep the part number. And it occurred to me that I have gotten NE602's long after the SA parts appeared.

HOWEVER, Phillips lists no NE parts under their RF parts, nor as parts "similar to" the SA602. Although it is certainly not exhaustive, all the "NE" parts still in my parts drawer have Signetics logos (no 602's tho - 604/605/614/615 all my 602/612's are SA).

Source record: 14581

Since the 1N4007 isn't a dual, why do you require a dual varactor? I'd expect diodes specifically made to be varactors would have less variation from part to part with respect to capacitance than would some other random diode.

Have you tried Mouser (as Professor suggests) or DigiKey, or some of the surplus places like MPJA?

I've heard that 1N4007s commonly make decent PIN diodes. If that's the case, if they really are made as a PIN structure, I would think they'd make lousy varactors. Wide-tuning-range varactors are commonly "hyper-abrupt" junctions, NOT PINs.

Cheers,
Tom

A lead-lag filter with the pole out beyond 2.5GHz may do it for you, but
I have no idea how you'd actually implement it.

Ditto for cleverly placed stubs.

And don't call me when the next batch has slightly different
characteristics, or when the one you have varies with temperature.

I recall someone writing about this in QEX quite a while back -- it was
his first time designing an IF for a radar, and it had to be WIDE band.

Hello Jim,

> Good idea, Joerg. Where do I get onesie-twosie IR sensors that will trigger
> at 3 meters or better?
>

No idea but one source might be remote controls and the corresponding receiver diode in the set or from a stereo. I bet that Radio Shack will have something if there still is one in your area (our became a cell phone store). You'd need a crude reflector on the other side, piece of metal or white board.

Another source might be if someone replaces their garage door opener. They usually come complete with the child protect barrier and most people will throw out the old one.

Thing is, you need at least two sets. The LEDs could be running all the time and you just have to sense the receive elements.

There is yet one more method: Two coils next to the road, each with oscillator. On fence posts, wherever. A car will de-tune it or, if set on the edge of the stable feedback range, would stop the oscillator momentarily. In contrast to the IR method and the Doppler method this can be made pretty weather proof from cheap wire.

Regards, Joerg

I'm building a circuit that calls for a dual monolithic
jfet. Can I use two discrete jfets that I have matched
for IDSS in the circuit? They are in TO92 plastic
cases, I can glue the two in contact with each other
so they end up at the same temperature.

The amps are well before the ADCs -- ADCs that sample at anything approaching
1Gsps have atrocious dynamic range compared to an analog signal processing
chain with a decent noise floor (e.g., 6 bits giving about 40dB dynamic range
vs. 80-100dB dynamic range back in the analog domain).

Gary,
I'm in the process of finishing a new display for my "Roanoke Doppler".
Do a search on that name and you'll get many hits. For just the antenna,
the Homing In Web site has info on both main types in common use. I'm not
sure what the Dick Smith does, but perhaps Homing-In talks about it.

Homing In is the place to start:
http://members.aol.com/homingin/index.html

It has antenna system (typically 1/4 wave whips for the Ham units)
references:
Down a ways on the main page under Home Built:
http://members.aol.com/homingin/newdopant2.html

This specificlly addresses the Dick Smith unit:
http://members.aol.com/homingin/DSEfix.html

You can always email K0OV.

The standard advise from K0OV is to NOT ground the unused antennas, but to leave them open which is in a non resonant state. This is so they have minimal effect on the active antenna and thus do not act like a parasitic element. I'm not sure why, but he recommends having NO amplitude (pattern) effects in your system.

Just call your local cop shop, and find out where they get their radar
guns - if these kids are posing a threat to life and limb, the cops might
come out and do it for you.

Good Luck!
Rich

From the looks of the package, Varactor or PIN diode. I think varactors
will have a 0.7 Vf possibly eliminating that, but don't recall PIN diode Vf.
Been too long...Do IR LEDS have that voltage?

Crack some open. There may be multiple die or something.

I don't know where this thread went, but... Perhaps I missed it, but try searching on Gunplexer.

That should get you to the ham sites where such things are talked about and sources named. Hams use them on 10 GHz and it would be a simple matter to detect the Doppler freq and do some sort of frequency detect.

Oh hell. here's some of my links:

Maybe I'm confusing this with something else but I always thought 1N4007's were 1000 V PIV, 1 A rectifiers.

I believe "any" diode has varactor characteristics to some extent but if you need a varactor you'd be better off using one designed as a varactor.

All diodes exhibit varactor and zener traits but not all are stable
as such. All diodes when reverse biased exhibit a value of capacitance
across them. In most cases it's usually quite small, less than 5 to 10pf.
Increase the reverse bias and the capacitance goes down. At very high frequencies
the capacitance change is enough to make a useful tuning diode. If you need
a varactor to work at medium to high frequencies the tuning effect won't be
very useful and you should use a true varactor diode. Such diodes have
either larger areas, or thinner substrates to increase th capacitance.

Any diode will work as a Zener, the zener voltage is where the reverse breakdown
occurs. In a true Zener, the breakdown voltage is stable over a large range
of current without the diode self destructing. Using a common diode as a zener
requires limiting the reverse current to a small value, but if the current isn't
large enough the zener voltage won't be stable.

And yes the 1n4007 is a 1000 vpiv rectifier diode. It also makes a good
rf switching diode thanks to it's PIN like structure. It's also quite cheap.

352. Re: Compensating frequency response of wideband amplifiers

Source record: 14603

Wouldn't it be a lot easier to just use a part that's inherently flatter? How about a Sirenza SBB-4089, for example.

If you really want to compensate a part that has some rolloff, you could try, along your 50 ohm transmission line, putting in series a shunt combination of an R and a C. The R adds some attenuation, and the C shorts it out at high frequencies. You need to use tiny parts to avoid problems with parasitic C and L. 0603 or 0402 should work OK. You need to take into account the driving amplifier's output impedance, and the load's impedance, and their variation with frequency. If you use multiple sections like that, you can tailor the response better than you can do with a single section. You could add in some inductance in series with resistance, shunt to ground, if you could find some inductance that behaves nicely at 2.5GHz. Maybe a shorted stub? That would let you keep a more constant load impedance versus frequency for the driving amplifier.

And what use would a 6 bit wideband system be anyway? What are you receiving with it that doesn't require more dynamic range than you'll get with 6 bits? And if you're only sampling at 1GHz, why are you worried about anything more than about 400MHz bandwidth?

Much more interesting to be looking at 14 or more bits...I keep telling the ADC manufacturers that I'd like 18 bits, with noise and distortion to match. Haven't been demanding a 5Gs/s rate yet though. Wouldn't quite know what to do with the data stream.

Cheers,
Tom

A strobe light. The radar 'your speed is..' signs don't do much to
discourage the a*holes. They just try to see what sort of quarter mile
speed they can hit.

The ones with the strobe make them wonder whether they'll be getting one
of those photo tickets in the mail.

Yes, you can but the closer the match the better.
Two parts form the same lot/datecode with the same
IDSS should be ok.

I've done this with MPF102s (a wide tolerence part)
with good results in all but extremely critical designs.

Further to the frequency response compensation:

In a world of ideal R, L and C components, you can insert an attenuator into a transmission line, matched to the line's characteristic impedance, to get frequency-independent attenuation while maintaining good return-loss from both input and output ports. If you then modify that circuit by shunting a capacitor across the attenuator, and lifting the ground-return of the attenuator and inserting an inductor in series to ground, and the inductor and capacitor each have reactances equal in magnitude to the line's impedance at some frequency F (assuming a non-reactive, constant impedance line here), the system will still have good return loss at all frequencies, and will have attenuation equal to that of the attenuator alone at DC, and no attenuation at frequencies far enough above F. In the transition region, the maximum slope of the attenuation will be 6dB/octave. That maximum will not be reached for low values of attenuation. If you cascade such sections, with each section having a different frequency F and perhaps differing attenuations, you can make a tailored response adjustment. Cascading identical sections of high enough ultimate attenuation results in maximum slopes in excess of 6dB/octave. Obviously trading the places of the inductor and capacitor give you the opposite shape: more attenuation at higher frequencies.

I have a little RFSim99 circuit that illustrates this idea--email if you'd like the file.

It's going to get really difficult to make this work right at high frequencies, because of the size of the parts and the parasitics involved. But with modern parts, you might be able to make it work well out to a couple GHz.

Cheers,
Tom

Zener diodes have much more capacitance than this, with the amount of C being greater as the zener voltage gets lower. It's been a long time since I've looked at this, but as I recall you can get well over 100 pF from something like a 5 V zener. For the same reason, reverse biased E-B junctions can give quite a bit of C. Of course, the limited breakdown voltage limits your tuning range. Higher power zeners have higher C yet.

I've used zeners for varicaps many times in HF rigs, to offset a VFO when switching bands, and for RIT. Haven't tried one as the main tuning capacitor, but I haven't tried a regular varicap, either.

Diodes specified for varicap use have more predictable capacitance-vs-voltage characteristics, and you can get a variety of different characteristics. They might have lower noise, too, but I've never used one in an application where that was critical, so don't know if that's the case. But for a lot of one-off projects, zeners work fine as varicaps.

As for using something else as zeners, emitter-base junctions work well. You don't get much variety, though -- most break down at around 5-6 volts. I've got a power supply I built over 30 years ago which uses a couple of series transistor E-B junctions as the voltage reference. It's still my main bench supply.

Flourescent, mainly because I can get the fixtures for nothing. People
are always tossing them out in all shapes and sizes.(Some can be
extremely wasteful when remodeling or rebuilding.)
Also flouro is of course much more efficient resulting in much lower
electricity bills for your shop.
I also have a number of the flex-arm work lights, both flourescent as
well as incandescent. I have one mounted on the corner of my work
bench for all the close up work I have to do.(The incandescent
flex-arm lamps can easily be converted to flouro for general work by
using a screw in spiral tube flourescent bulb , or converted back to
high watt incandescent for work requiring more intense light.)

People toss out those flourescent aquarium light fixtures all the
time.
Most are 18 inch and make excellent under shelf light fixtures for
light directly on the bench.
The tubes are easily swapped out for normal balanced tubes and the
black plastic housing usually have open spaces on either end to allow
drilling holes for mounting to the under shelf.(I use #8 x 1 inch
sheet metal screws with fender washers to mount them. takes just a
couple of minutes and you've got a nifty under shelf light for next to
nothing.)

As far as I'm aware, pretty much all high data rate digital modulation
schemes can be recovered with 6 bits (or less).

OK, 1.25Gsps? :-) I'm just talking ballpark figures.

"radio" implied to me that you are dealing with a multitude of signals in that bandwidth, not just one, and my practical experience tells me that you will have to deal with a wide dynamic range. What do you do with the interfering signal that's 20dB above your signal of interest? If you're wired between the source and the receiver with no outside signals getting in, I wonder if you're engaging in overkill for the receiver...

OK, so 1.25Gsps gets you to maybe 500MHz bandwidth. That's still a far cry from 2GHz. Why would you be worried about the flatness over 2GHz when your bandwidth is "only" 500MHz?

Of course, there are 'scopes available these days that sample a lot faster than that.

Cheers,
Tom

Ah, the classic wideband SDR problem! You filter it out, of course, with an adjustable notch filter (or two or three or...). Or at least that's all I know to do about them...

> OK, so 1.25Gsps gets you to maybe 500MHz bandwidth. That's still a far

So that you can tune around over 2 or 3GHz and everything's still flat. I realize that's probably not really absolutely necessary, but as I say, people are asking for these levels of flatness, and if it's readily doable sometimes it's easier just to do what's ask rather than try to educate them about why their request isn't really needed. :-)

I'd go with try it first.

Also base collector junction of many transistors is fairly decent
varactor. Low power transistors tend to be low capacitance
and the amount of capacitance increases with device dies size
(power level).

I don't know either, I just put in Cholla & Scottsdale Rd, Scottsdale,
AZ 85254 and then scrolled west.

I then read off and noted the latitude and longitude in case someone
knew how to do it directly.

Dr. G,
You are correct, but many circuits have used the 1N4000 series diodes as varactors with acceptable results. Any diode is a varactor (even transistor junctions), but those called varactors are just optimized for and measured/spec'ed as variable caps. If the cap value works in the circuit and losses/noise/whatever-else aren't a problem, then no problem. I chalk it up to: Some of us don't have the luxury of either well stocked basements or pocket books, or perhaps the willingness to run out to the local parts store (if you have one) and pick something out just to throw some neat little thingy together.

Don't (some) zeners generate noise???...or is that only near the breakdown reigion?

Some are very noisy. The noisiest I've seen have been ones in the 12 - 15 volt range when biased at considerably less than a mA. I've used one, followed by a 50 ohm amplifier "pill" IC, as a broadband noise source to see filter responses with a spectrum analyzer. The noise is easily visible well up into the UHF region.

But all zeners generate some noise, so you have to use appropriate filtering in sensitive applications. In my experience, though, band gap references can be even noisier than a typical zener.

Roy ...

I've been playing around (ahem, excuse me, heuristically engineering) with zener noise sources for a while using the same spectrum analyzer trick and as yet I haven't been able to make the noise as "flat" across the passband as I'd like. I've tried varying the bias, the voltage, and a few other tricks, but as yet, no joy.

Can you shed some light on what you've found to make the noise power/voltage fairly level across the band?

Jim

It's not particularly flat over the whole band, and I haven't attempted to make it be. My interest has been mostly in relatively narrow band filters, or the shape of a main filter rolloff. The noise is adequately flat over the bandwidths I've been interested in. It's been a while since I've fooled with it, but as I recall, the shape of the noise spectral distribution changed all over the map as I changed the diode bias. I imagine that it changes with temperature and with individual diodes, too. So any circuit used to flatten it would only work for a particular diode, current, and probably temperature. The bottom line is that it's probably a lousy way to try to generate a flat broadband noise spectrum.

Roy Lewallen, W7EL

Good zener noise sources are carefully bred and tested, they
do _not_ come naturally from garden-variety zener diodes. I
suggest you go read the hundred or so messages in the famous
zener oscillation thread a few years back here on s.e.d. In
this you'll learn of my substantial investigations into the
topic, some physics - and, very important, learn what a zener
microplasma is. You'll see my ASCII waveform plots of actual
bench measurements showing exactly what's going on. After all
this you may decide to avoid using zener diodes for calibrated
noise sources. Sorry about that!

What I did for some project which needed equal amplitude
uncorrelated noise,is amplify the zener noise with a wide
band video opamp,with high pass and lowpass filtering.
Used the low pass as input for a zero cross detector,
delayed the zerocrossing 10 microseconds,and used that
for clock to a circulating bit in a shift register.
each parallel output of that register controlled a
sample/hold opamp,sampling the highpass signal.
Voila!! 8 audio frequency, non-correlated noise sources.
The zerocrossing clock was made this way,to avoid detectable
clock tones int the output.(2 to 20 microsec between
crossings)

the 10 microsecond delay was used to get a voltage at
the sample and hold opamp which was not correlated to the
zerocrossing.
If you need only one signal ,leave out the shift register,
and just use a 10 and a 1 microsec. oneshot for the s/h
opamp clock.
The application? A wind and engine noise generator for a
car simulator.

Zeners are also often used as noise sources, which might be a good reason NOT
to use them for the tuning, especially in a receiver.

I am looking for an inexpensive digital strip chart recorder.

Does something like this exist?

Are there addons for a laptop, pda or pocket pc that allows one to
record, store and display analog data similar to the good old chart
recorder?

Thanks for any leads.

You mean that a zener diode biased at less than breakdown voltage generates more noise than a diode specified for varactor use biased at less than breakdown? I assume this noise would be in the form of time jitter of the capacitance, since the leakage current would be very small. Have you seen this in some specification, or is it from experience?

In the breakdown region yes, in the revserse bias region no. I've
tried some .4w 22V Zeners and they are decent varactors save for
you need to keep far enough from the 22V and -.5V or they exhibit
their other charactersistics.

Interesting coincidence... I got a 545, complete with cart and
probes, for free, several years ago. A bit cumbersome in my limited
lab space in the basement, but the price couldn't be beat.

It finally died on me. I sold it for parts and bought a nice 465B
(off the e-place, where else) that now sits on the same cart. What I
got for the 545 bought me a copule of probes -- all's well that ends
well...

Inexpensive and "strip chart recorder" are mutually exclusive.

Yes, there are lots of addons, google gets tons of hits
"http://www.google.com/search?hl=en&q=analog+data+recorders"

The next question is: "how much do you want to spend ?? "

Portable, USB, serial, ... lots of questions.

What are you trying to measure will determine what kind of analog data
recorder to buy.

Not to mention, Audio.

THD is usefult to a point, but can't really tell how pleasant,
subjectively, the sound will be. A spectrum display provides the
missing insight.

I would agree...I am surprised that in today's world of electronics
that an inexpensive turnkey appliance is not available.

The uses for something like this is many....and I am not trying to be
specific since this will be used to measure a number of physical
parameters.

Let's say one wants a digital solution to what a old HP 680 Strip Chart
Recorder would work for...is there anything out there today that works
the same?

Radio Shack used to sell a Metex VOM (Metex ME-11) that had a serial port output and software that made essentially a data logger which you could then pop into an excel or Quattro spreadsheet and massage the data anyway you liked. I bought two of them from their on-line catalog when they were on sale maybe 3 years ago, suspect you can still find them, maybe with an USB port these days. I use one of mine for metering the transmitted signal from NAA to detect SIDS. Lots more practical than my old Rustrak strip chart recorder, I can just throw away the "uninteresting" data and not use any paper at all. The other one is just a backup for my Fluke 77.

I think that whether noisy or not, the noise generation mechanism kicks in, only when the zeners are reverse conducting via the zener breakdown process, so if you keep the voltage well below the zener knee, say, half of that, they are not particularly noisy compared to other diodes. So, yes, only near the breakdown region, especially just below the rated voltage (low reverse current).

Something like the USB-1208LS from Measurement Computing (I'd post a
link but their referral/tag/cookie system seems to want two or three
lines for the URL) plus an old laptop PC might do the trick.

It's a relatively inexpensive USB gadget that comes with basic "strip
chart" software as a demo app. They have other, faster, and more
expensive models and more software, of course. IIRC, they still include
their Universal Library w/ the device, so you can write your own apps
with your own look & feel.

Higher end stuff is available from places like http://www.astro-med.com/
... and priced accordingly. Good gear, though.

OK,

So the spec's are: not battery operated and must weight in at about 15
pounds. ;-)

I have used some of the smaller devices at :
http://www.dataq.com/c_cr/index.htm

There will be trade offs on "chart speed" = sample rate and resolution
(step size) and max input voltage.

good luck

donald

403. glass-mount omnidirectional antenna?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-11 04:01:17 UTC
From: kevincw01 <kevincw01@gmail.com>
Message-ID: <1136950193.497960.83860@g47g2000cwa.googlegroups.com>
Source record: 14504

I used to have a in-car cell phone system and it had a glass-mount antenna which didn't require drilling. Basically, there was coax(conntected to the cell) to a plate that stuck to the inside of the rear window. Then on the outside of that window was another plate with the antenna attached to it. You can buy these a radio shack I noticed. I've also seem the same done for XM/Sirius Satellite radio.

I have searched and searched and so far have not found the same thing for 2.4 ghz wifi. Does anyone know where I can find one? If not, could it be as simple as removing the cell antenna from the exterior plate(of the radio shack cellular version) and reattaching a 2.4 ghz omni? Or maybe I could modify the existing cell antenna to the correct 1/2 wavelength of 2.4ghz?

Your suggestions / help / tips are appreciated.

-Kevin

> I know there is the datssheet but it is a bit complicated, I am also trying
> to learn the PIC16F870.
>
> JE

If all you need is a /64 prescaler, then you shouldn't need to program
anything, with a PIC or otherwise. (Hint: ditch the PIC and move to
Atmel, where there's a nice free C/C++ compiler for the Googling).

Those LMX parts do a lot more than just divide. Have you tried punching
"prescaler" into the search boxes at digikey.com and mouser.com? It
could save quite a bit of work with a chip that's not exactly right for
your needs...

Haven't seen a 2.4G unit, which doesn't mean they aren't out there.

But the through-glass coupling is fairly narrowband and incorporates tuning
elements. The 800/900 MHz units would present a shocking SWR at 2.4G.

>
> Of the racks used, are they full racks or partial racks with storage?
>
> For storage, what do you use...cabinets, shelves, chests?
>
> What do you for lighting?
==========
I use vertical double-slotted wall mounted support strips , such that brackets for desk tops and shelves can be positioned at will also below desk level for extra storage. Larger test equipment like scopes ,variable PSUs , Variac , HiPot tester all sit on shelves. Handheld test equipment is kept in a cupboard.
Desk lighting are a number of 12V Halogen reflector bulbs (encapped in glass ......watch UV radiation,possibly causing skin cancer, when using open reflectors with replacable bulbs) ,fitted on a rail clamped to lower shelf edge
On separate smaller desk where soldering is done I have a circular fluorescent light combined with a magnifying glass (at my age essential for doing sm work)
Components are stored either in wall-mounted plastic drawers or in separate plastic boxes incl those normally used for icecream etc.

Main operating /testing desk is 3 metres (approx 10ft) long ,desk top is 750 mm (approx 30 inches) from floor ,eg slightly higher than a normal table. Reason : comfortable height ,such that when sitting on a adjustable (pneumatic) office chair ,the angle between upper and lower leg is slighly larger than 90 degrees with lower leg at right angle with floor.

Desktop is composite board with 'formica' (hard plastic) lining (in the UK at least) normally used for kitchen tops .Desk top depth is 900 mm or approx 36 inches ,such that with CRT VDU and pre-1990 size transceivers ,there is adequate desk space for (log) book and other paperwork.

Note : The adjustable shelving bracket system enables change of shelving height and distance to suit dimensions of new (test) equipment.
Vertical wall mounted slotted support strips are spaced 600 mm (approx 2 ft) to enable carrying of relatively heavy equipment. The slotted strips are 2.5 metres long . This means they run almost from floor level to a level an 'A4 binder height' above the upper shelf to enable fitting

of matching book supports .Also to fit brackets and shelves below
desktop level ,for extra storage.

Frank KN6WH / GM0CSZ (still a few days to come in W6-land)
now partly migrated to Linux.

Source record: 14511

John A,
Spot on we have reverse breakdown at around 15 to 20 volts dependant on current, this is obviously not a high voltage diode!!!
By the way yes the cross bar is the cathode. All the (known) varactors I have measure a vf around the 0.6-0.7 volt and so do the PIN's I have, though I don't have a really extensive collection of either, this is why I had ruled them out but if you know of other examples then its sounding good.

So so far we know:
Forward Voltage ~ 1.4 -1.5 V
Reverse Voltage Breakdown ~ 15-20V
No Visible or IR light emitted.
Small Signal RF like packaging with cross bar indicating cathode.

So what is left?, 2 series 10V Zeners?

I may have to break one open and get out a microscope yet.

Paul.

That's one thread, perhaps the first in a series. That thread doesn't have the waveforms I was referring to (although there are some waveforms in posts 51 and 66). Tony, Bill, Roy and I, and some others here wasted masses of time on this subject over a period of a few months, eight and a half years ago. We took bench measurements, did calculations, found the scientific literature (it was a subject that occupied physicists in the late 50s, see posts 72-76), and we did plenty of speculation.

...impossible to tell! nobody ever characterized them for high
frequency use. the usual effects of the varactor are pernicious! they
are crucial for low phase noise of the VCO using them. the only truly
effective way to check is build one and measure the performance with a
spectrum analyzer or a phase noise meter, both expensive items. my
recommendation is to build one and try to listen to its signal on a
receiver (stable one!), if the note is clean and not ragged it's OK. if
not the VCO is too noisy for use. don't be afraid to check more than
one diode in the same circuit. experience has shown that some units
perform better than others.

>ratio?

Standing wave ratio. It is a measure of how well (in this case) the antenna system accepts the energy sent to it up the transmission line and radiates it, compared to reflecting it back to the source transmitter. The transmission line should be 50 ohm coax in your case. If the tranmission line/system has serious impedance variation or discontinuity, power is reflected back to the source rather than passing along the line.

As the through-glass coupling system employs frequency-sensitive tuned circuit elements, a substantial change in frequency as you suggest will certainly create a serious impedance discontinuity. Overall transmission efficiency pooter<-> antenna would be very poor as a result. You may well find that a decent 2.4G antenna on the pooter inside the vehicle is more efficient.

420. Spanish at Home

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-11 14:14:48 UTC
From: PLENI SELENE <pleniselene45@yahoo.com>
Message-ID: <1137010558_159@sp6iad.superfeed.net>
Source record: 14535

HOW FAR TECHNOLOGY MOVES FROM TALK TO ROBOTS,

Would you Like To Know How The Electronic Devices Understand When You Talk to Them, And How It Works To Speak Spanish?

Because spelling words and names are common in English, Software have been developed to code names based on how they sound. Searching and matching is done by converting a word or name to some phonetic code. Phonetic encoding technology is also used for the command voice in electronic devices like cell phones(to make calls), answering machines(to select menu options), toys, cars(for security), house(to control the lights) and a lot of more applications, It is why when somebody order to the cell phone " office" the cell phone make a call to the office, or the lights turn on when you say "lights", etc.
Some of the best video games come in Spanish
Learn Spanish reading in English
I have exciting news for anybody who wants to learn to communicate in Spanish. You can get a flying start and begin communicating in Spanish in 15 days or less it depends of you. In fact, with just 125 Spanish words (75 key words and 50 most common and used Spanish words) anyone can communicate in Spanish.
Just 26 letters make all English literature and 75 Spanish key words are all you need to begin communicating effectively in Spanish, these are:
- Alphabet(26 letters)(a, b, c, d, e ..... x, y, z)
- Three articles(el, la, los)
- Pronouns(7)(I, you, he, she, It, we, they)
- Prepositions(18)(a, an, from, of, with, ... in, on)
- Verb to Be(3)(am, are, is)
- Numbers(0-9)(zero, one, two ..... nine, ten)
- Interrogatives(8)(what, who, ..., how, whom)

Combine these 75 key words as a communication multipliers to make your learning time productive and create real usable Spanish output.
Now anyone can speak Spanish with "Spanish By Myself" guide. This fascinating guide makes speaking Spanish as easy as speak English, just need to know read in English, yes, read in English and learn the correct Spanish pronunciation of the most used key words that give you the most strong communication skills

AMAZINGLY, with just 75 Spanish Key words and 50 most used common Spanish words, you can actually make over 85,000 Spanish sentences and say just about anything you will want to say in Spanish.

Let me give you more examples:

REMEMBER: Read the "pronunciation" sentence in English It will sound in Spanish.

ENGLISH SENTENCE : Good morning How are you?
SPANISH SENTENCE : Buenos dias como esta?
PRONUNCIATION : Boo_n_oz d_us Koh_moh ess_tah?

ENGLISH SENTENCE: My name is Ann, What is your name?
SPANISH SENTENCE: Mi nombre es Ann cual es su nombre?
PRONUNCIATION : Mee nohm_breh ess Ann,
Kuh_al ess sue nohm_breh?

ENGLISH SENTENCE: I would like to be your friend
SPANISH SENTENCE : Me gustaria ser tu amigo(a)
PRONUNCIATION : Meh goose_tah_rih_ah sehr two ah_mee_goh

ENGLISH SENTENCE : your son likes to play ball
SPANISH SENTENCE : a tu hijo le gusta jugar pelota
PRONUNCIATION : ah two ee_ho leh Goose_tah
Hoo_gahr peh_loh_tah.

ENGLISH SENTENCE : The party is in my house
SPANISH SENTENCE : La fiesta es en mi casa
PRONUNCIATION : Lah Fee_ess_tah ess n mee kah_sah

ENGLISH SENTENCE : I want a glass of water
SPANISH SENTENCE : Yo quiero un vaso con agua
PRONUNCIATION : yoh kee_eh_roh oon vah_soh kohn ah_guh_ah

It isn't fun, you will find a lot of more examples inside the guide but the best of the best is that you will learn how make your own sentences, isn't great!, I will teach you the 75 Spanish key words and the 50 common and most used words plus hundreds of words for specific conversations with the pronunciation of all of them, and how you can combine them.

Also you will learn good manners in Spanish, the months of the year, the days of the week, colors, words to use at the restaurant, at home, at school, at work and much more.

Don't think to much about it, there are so many people who want to learn speak Spanish and I'm sure you don't want to stay behind, there are a lot of opportunities for the people who speak English and Spanish, not only for jobs, but to do new friends, to do business or just to know speak Spanish and be more competitive in this world. Take your future in your hands, nobody is going to do it for you, you have to make decision by your self, and this is a good one.

Get your Guide now for a half price and you will receive the bonuses

What is stopping you?
Look, I do know that you are reading this message, it is because you want to learn speak Spanish and of course, you do realize that you need to study to achieve your goal. So there's no reason not to get my Guide, you just have to read in English and then the Spanish flow in your mouth naturally without effort.

ORDER NOW at www.spanishbymyself.com

Please forward this to a friend. It will highlight his day. Once forwarded, look for the complete information about the guide at this address:

Independent datalogger that is connected to your computer via USB.
Program it and download data from it. About 99 bucks.

Al

I never tested a zener when used as varactor but I think these have a
much greater reverse saturation current (even far below breakdown
threshold) and it is this that might cause comparatively more noise
than a conventional diode with a tiny leakage current. Well, at least
that is what the junction noise equations would seem to indicate.

While a paper strip recorder might have seemed a good idea back in its day, actually using one in this day and age would be a rather obvious waste of paper. The kind of device you're looking for is called a storage oscilloscope or data logger, these days, mostly depending on its typical sampling rate and number of channels.

Any computer or PDA with decent sound hardware should suffice for a working, no-cost, software-only approach. Just connect your analog input to line-in (adapt level and impedance as needed), and record your signal as an audio stream, which you can later transform into whatever kind of plot or display you like. It won't be spectacularly accurate, granted, but it'll still outperform a paper strip plotter on all practical counts.

==========
Zener diodes are often used as wide band 'noise generators'for use in an impedance bridge used in conjunction with a receiver.

OK, then. A zener makes a poor noise source according to what I'm reading. Noise.com used to sell off-spec diodes by the onesies for we poor peons to play with, but for whatever reason that doesn't seem to be the case any more.

Given that a zener (at whatever current) is a poor noise source, what is a good source of electronic broadband noise from low HF through high UHF -- say, 5 to 500 MHz.? (No smart remarks about spark gaps.)

A hot resistor.

How about a thermistor or a lamp filament that was 50 ohms at some
high temperature. You could heat it with DC, sense its
resistance/temp, and let it make noise, all in a single part.

Old vintage noise figure meters used gas tubes. And I think there was
a pencil tube that mounted in a waveguide and made shot noise.

And, of course, the old photomultiplier trick.

John

I have seen a small "gain of wheat" type light bulb used as a noise source...

Feed it with DC through a choke and AC couple the noise out ....

and you can vary it too!!

Immediately you say "choke" you have modified and peaked the bandwidth.
I'll buy that you can feed it with a resistor for broadband, but in my
humble opinion the construction of a grain of wheat bulb won't get up into
the UHF region with noise. Do you have any idea of the output level of this
circuit?

I still like the flashlight/photodiode trick. You can get a really good calibration just from the dc, and can calibrate the frequency response with a spark plug.

Cheers,

Phil Hobbs

I've got a gaussian noise generator, some SS in the power supply, tubes everywhere else, found it on the curb and apparently works. Uses a pair of 6D4 thyratrons in magnetic fields for the noise.

What's the light-flash waveform look like from a spark plug? What do
you drive it with?

Don't you have gobs of femtosecond lasers around your place?

says...
> Another great idea thanks.Lots to choice from NEC. Why don't US companies
> make prescalers?

I think On Semiconductor (formerly Motorola) might be your only choice
there; not sure they're still in the business. There's also California
Eastern Labs (www.cel.com), but they may just be reselling NEC parts.
Not super-familiar with the prescaler world these days.

> Where do I get this free C/C++ compiler and which Atmel chips do you
> recommend to start?

Atmel partisans tend to favor the "WinAVR" distribution of avr-gcc (
http://www.avrfreaks.net/AVRGCC/ , or just Google for avr-gcc or winavr
). There are also commercial compilers for the chip, but I don't know
anything about them.

I usually use the ATmega128 for everything, out of laziness. In the
past, I've also compiled my hybrid synth driver (LMX/ADF-series PLL
control, plus DDS control, plus 2-line LCD and numeric-keypad UI) on the
ATmega32. This is the most capable Atmel chip that's still available in
a 40-pin DIP. Flash memory space was a bit cramped, but there's a lot
you can do to optimize the generated code when things get tight. (I
have a bad habit of using 64-bit ints for timers and such, and that
costs a LOT of code space on an 8-bit controller.)

If all you want to do is program the prescaler section of a PLL chip,
I'm sure the cheapest/smallest TinyAVR chip supported by GCC would do
just fine.

The C/C++ learning curve isn't too bad, because the platform limitations
will rule out many of the fancier C++ language constructs. Straight
ANSI C advocates will be very happy campers. The obvious advantage to
writing C on your microcontroller is that the time spent on the learning
curve won't be wasted if/when you move to a new microcontroller family.
Contrary to conventional wisdom, you will NOT end up having to learn AVR
assembly anyway to debug your design. The compiler works great.

There's nothing worse than people who go around bellowing "My CPU is
better than your CPU!," but I hate to see people spending valuable time
learning a dead-end language like PIC assembly for one-off projects.

Daft question time again.

I've got some ceramic filters in some radios that are too wide.

First:
I've got a repeater with a 455khz IF filter that's the 3 pin type, marked "55F" and "CM". It's in a FX5000 reciever.

Second:
I've got some mobiles with the larger filters, marked LT455FW.

I want to put these all onto a nice and tight filter. The problem is that I'm trying to use 145.625, but there's two repeaters on 145.6125 and 145.6375 locally, so a frequency shift won't do anything. Deviation is 2.5khz peak

1: What sort of bandwidth do people recommend? I have been told that 9khz would work a treat, but I don't know if I should go narrower or wider?

2: I've found this site: http://www.euroquartz.co.uk/ceramic-filt.htm

What are all the filter types, what do they mean (like the LTW33, LTS, etc, etc), and which models would be suitable substitutes?

Look forward to people's responses, because this is confusing me now!

Jim wrote: "...what is a good source of electronic broadband noise
from low HF through high UHF -- say, 5 to 500 MHz.?"

A linear feedback shift register. Small, repeatable. 500MHz should be
no particular problem these days. (There's an idea for some IC
manufacturer...32 bits clocked at 1G/sec repeats every 4 seconds, which
would be OK, but I'd prefer 40 or more bits. Should fit nicely into a
5 pin SOT-23: power, gnd, reset, out, ...)

>604/605/614/615 all my 602/612's are SA).

Er, Philips has owned Signetics since about 1976. (Along with Mullard
and about a half a dozen other regional names which they dropped sometime
in the late 80's). In the 1989 Signetics Linear:Communications databook,
the NE/SA parts are on the same datasheet.

All the demise of the NE602 number says is that Philips has selected
their parts catalog to those items that earn the most money. Since
a low integration part like the '602 would mostly be used in portable
radios or other legacy telcom applications, they probably weren't
selling too many of the narrow temp. range.

I've used noisecom for some years, but they are hard to buy in
onesie-twosies and are rather expensive in quantity when you only need one.

They USED to sell seconds that didn't meet spec, but I don't see that offer
on their current website.

Is it a General Radio noise generator? I have an old GR noise
generator, and the manual talks about moving the magnet around to
optimize something.

That's an amazing extension. Plenty of healthy Massachusetts companies have been sucked dry by their out-of-state owners. Obviously the ability to mis-manage a company from a distance is not notably a Massachusetts sin, unless you're obsessed with the Harvard Business School's modest influence on the issue.

Ah, had a feeling it was something about a manufacturer...

Unfortunately(?) no, it appears to be Elgenco, and I also now remember not finding much info on this device after I picked it up. It's a rack mount unit BTW.

I doubt that it's two series zeners, since it's no trick to make a single zener with that breakdown voltage.

The only application I know of for series connected diodes with that sort of breakdown voltage is for high dynamic range mixers. But the pairs I've seen in a single package have a third pin at the junction so you can also use them for other applications.

I wonder if it might be a low-C varactor. The very low C ones might possibly consist of two diodes in series -- the manufacturers don't give any clues since they don't publish any data on the forward bias characteristics. The breakdown voltage of low C varactors is in that ballpark, and the packaging is consistent with that possibility.

They also have a whale of a lot more capacitance than a conventional diode. So I don't think it's a fair comparison.

It is sadly true that many of the old-line Rt 128 companies are
gone... DEC, Data General, GR, Sensitive Instruments, Clevite,
Transitron, probably others. Have others popped up to take their
place? Analog Devices, for sure.

John

Okay, if we are discussing strange and high capacitance varactors,
what would you think of using a PIN photo diode as a varactor? They
have more chip area per dollar and per package size and capacitance
than many rectifier diodes, and that are made to have low leakage
current and often have low inductance packaging.
For example:
http://rocky.digikey.com/WebLib/Osram/Web%20Data/bpw34fa_fas.pdf
looks like a nice 15 to 70 pF capacitor.

I guess you would have to keep them in the dark, unless you wanted to
tune them (biased by a high resistance to a fixed voltage) with a
variable intensity light beam.

I understand to generate the noise that the zener diodes are operated
within their normal breakdown current range. However, as a varactor it
isn't desirable to have a breakdown current flow. The only tiny
current that flows is a saturation current which is related to
setting up the P-N junction boundaries within the semiconductor.

If you're serious about decent peformance, stay away from glass
mount antennas for anything other than receive-only. They're worse than
useless for transmitting.

Trust me, I know this. My employer (WA State Patrol) tried some
glass mounts at one time for their undercover cars. Performance was
horrible, and other electronics in the car (notably the entertainment
radio and the key dinger) basically freaked out every time the
transmitter got keyed.

Once we changed back to regular through-hole or trunk-lid
antennas, the problems disappeared completely. It all has to do with
decent grounding.

> could it be as simple as removing the cell antenna from the exterior
> plate(of the radio shack cellular version) and reattaching a 2.4 ghz
> omni?

No. The coupling box of any glass-mount antenna contains a
frequency-sensitive matching circuit. A circuit designed for cellphone
frequencies will not work with WiFi freqs.

If you need a mobile WiFi antenna, and you don't want to drill
holes, use a magnetic mount.

Happy tweaking.

> ratio?

Oh dear... Someone didn't pay attention in license class...

SWR = Standing Wave Ratio. Put simply, it has to do with how good
of a load the antenna presents to the transmitter, and how efficiently
it will couple the transmitter's energy to the atmosphere.

It needs to be as close to 1:1 as possible. If you're using a
wattmeter to measure things, you want to see as low as possible a
reading in the 'reflected' mode and as high as possible in the
'forward' mode.

Here are some more details.

http://www.hamquick.com/tutorial_index.php?id=20

Happy tweaking.

Nothing to do with coupling the Tx energy to the "atmosphere". Terminating the
line in a resistor of the line's charactertistic impedance will present a nice
SWR and radiate very little.

Ok,
Both Roy and John A, have effectively suggested series HC Diodes or Low C Varicaps.
John A has found some data for an older Motorola HC diode the MBD502 that shows figures for Vf and VBr that are roughly similar in a roughly similar package. Roy also suggests the possibility of a low capacitance varicap, I suppose the way to tell would be to measure the capacitance verses reverse voltage characteristic. If it was something like a MBD502 then the capacitance would be pretty much constant at a low value, if it is a varicap it could also have a low ish value but should be varying a bit. Any ideas on a simple way to do this, I assume my classic multimeter cap range wouldn't like a DC voltage and a diode across it, and the other simple way I can think of of known L and a GDO seems a bit messy to measure possibly sub 1pf values?

By the way just in case anyone else is interested the place I got these from still says on their web site that they have some 82000 more which they are selling for $AUS0.0055 each for 1000 minimum which comes to AUS$5.50 for the 1000 see item 31118 at www.rockby.com.au .

> useless for transmitting.

I think you better stick to the paintings. Anecdotal evidence is worse than no evidence. Just because one manufacturer's antenna was junk doesn't mean they all are. There does seem to be considerable variability in glass mount antennas, though. Some people report good results, others horrible, and little in the middle. Still, at 2.4G I'd personally be a bit suspicious of glass mount.

However, OP has another problem. Nobody has mentioned feedline loss. The wire carrying the signal to the antenna, even with a good SWR, can be a real source of loss, especially at 2.4G. Cable which has a low loss at that frequency is available, but it is expensive and hard to get. As someone else has suggested, it may be better just to keep the antenna in the vehicle.

I would also caution OP, presuming he is in the U.S., there are pretty significant limitations to what he can do legally with WiFi. Besides power limitations, there are a number of other limitations designed to protect other users of that spectrum (including amateurs). WiFi is a tertiary user of that spectrum, and you are REQUIRED not to interfere with the other users. You are also required to accept interference from the primary and secondary users.

Now the odds that you will be called on interference either way are pretty small, but recognize that in general modifications, even something as simple as an external antenna, are disallowed by the regulations.

There's noise and then there's noise. Any signal we don't want we call
noise. A noise source for instumentation needs to have a flat spectrum.
The noise on a zener is a good example of the former and poor example of
the latter.

You use one of the circular-gap plugs, run it to a HV supply via a 10M
resistor, and just discharge the capacitance of the plug--you get a nice
irregular relaxation oscillation. It isn't the absolute most beautiful
pulse, but (a) it's easy to shield so you get rid of the pickup, (b)

it's surprisingly bright, and (c) the rising edge is way under 1 ns, which should be fine for the VHF to low UHF range. I might stick one on my sampling scope sometime and find out more about its actual performance, but this is a pretty common trick.

There are femtosecond lasers around here--my fastest one is about 20 ps, but it's continuously tunable from 420 nm to 10 microns, when it's working.

Cheers,

Phil Hobbs

We have scads of large wealthy "newer" high-tech companies
headquartered here, that you may not often hear of, like
Thermo Electron, Bruker, Summit Technology, EMC, etc., and
others you do know, with a substantial presence, like Agilent.

Many software and Internet companies are headquartered in MA,
like Peoplesoft, Novell, etc., and many others have a large
presence, like Sun, Red Hat, IBM, Microsoft, etc.

We all know scores of top-tier biotech companies with their
headquarters in MA, who have massive high-tech employment here.

Ah, Bruker, my arch-enemy. I make the gradient drivers and temperature
controllers for Varian. I've also had bad experiences with Bruker AXS
in Madison. They both seem to be very NIH and very PhD oriented, so
they're hard to deal with and especially sell to.

I'd probably look at the specs of the lower-end chips that support AVR-GCC. Some of them (ATtiny11L) don't even have any on-chip RAM, which makes me wonder how the stack works.

The difference in cost between the low and high end of the ATtiny range is only about $2.00, so I wouldn't waste time trying to make the cheaper parts work unless I were going to build 1000+ of whatever I was working on. The ATtiny45V sounds good, and DigiKey has 'em in stock (ATTINY45V-10PI-ND).

I know a lot of people use the AVRDude programmer (http://www.bsdhome.com/avrdude/), which apparently now works under both *nix and Win32. I use an STK-500 programmer myself, but those are fairly pricy even on eBay. Lots of options out there.

Sam,

This is what Engineers must struggle through. Looking at the data sheets I only see size differences in the different types. The electrical specs appear to be the same.

When filtering FM you must consider the bandwidth of the transmitted signal which includes the sidebands. Both of your received signals AND the adjacent channel transmitter SIDEBANDS. There needs to be space between the carriers to prevent interference and sidebands from one Tx shouldn't be within the next receiver's bandwidth. Not having my text with me I hope I analyze your numbers correctly. Just remember that FM is wider than just the modulation frequency (according to the Bessel functions).

Narrow band FM (B <1) is narrow, but it does have some bandwidth and it is twice the modulation frequency for sure and some at three time.

If I do the math correctly, your modulation index is about 2.5 / 3 or .833 (assuming 300-3,000 audio). I always have to think carefully how this ratio goes.

Using:

http://www.rfcafe.com/references/electrical/bessel.htm

This puts us to the left of the B=1 (on the horizontal axis on the bottom) and I see that the first and second sidebands (J1-black & J2-green dotted) are significant, but the third (J3-red dotted) is pretty small, so it may be attenuated in your filter with little resulting distortion. HOWEVER, this sideband IS PRESENT in yours and the other transmitters. This says that the second transmitter sidebands go out to +/- 6Kc AND with the third at +/- 9Kc being pretty small.

Now, The sidebands from the other stations do the same (assuming they are modulating correctly). This means that the one above you has sideband energy at its Fc-6kc (second sideband) and some at Fc-9kc (third sideband). Since its carrier is 12.5 kc. above you this puts them at 6.5kc. and 3.5kc. ABOVE your carrier frequency!

So, with the filter, you're trying to get rid of a component that is 6.5 Kc. above your carrier, that is the larger one, and one is 3.5kc. above your carrier, that is smaller one. (The others are there, but much, much smaller according to the Bessel curves).

The problem here is that you need to RECEIVE sidebands that are 3, 6, and to some extent 9 Kc. above your carrier from the desired stations. There is a conflict here and it is due to carrier spacing that is too close for FM.

You have to look at the filter curves to see which one will provide some attenuation at +/-6.5kc. The trouble is that it must pass +/- 6 Kc! You'll also never get rid of the component at 3.5Kc and still receive your desired second sideband at 6Kc.

The other unknown here is the location s of these systems and the stations that will be using them. If someone is far from and using your system, but close to one of the other systems you mention, those sidebands can be much stronger and cause more "splatter" in the eyes of the receiver.

Receivers, at least the ones I have been connected with the design of, take this into account and use filters that have all these considerations included in their design and try to keep the bandwidth wide enough to receive what it needs to receive and narrow enough • and with steep enough skirts -- to attenuate adjacent and alternate channel sidebands as much as feasible given economic constraints. There is, however a limit to how close you can put carriers and not get interference *REGARDLESS* of the shape of the filter at ANY expense.. I think you are past that limit.

I hope you understand "Kc." I 'm from a time long ago (:-)

I find that Hams don't understand the spacing of 2 meter systems and expect to put them on adjacent channels. You can (should) only do this when the systems are far enough apart so this sideband energy is low enough to keep this kind of interference below audible levels.

73, Steve, K,9.D;C'I

I'm sure this has been beaten to death already, but I missed it. Is there a very small SMT QRP kit or design somewhere, maybe on equal to the NorCal 40 or better? I'm aware of the SMK-1. Am looking for the smallest possible rig with 5W and good RX. Would it be reasonable to repackage, say, the NorCal 40 with all surface mount parts? Certainly someone must have already tried this. What results did you find?

By way of introduction, I am N9XI. My main rig is a K2, an early first run kit from '99. I think I understand the apparent trepidation surrounding SMT, although I believe it's unfounded and not entirely rational. After all this time, the dearth of very small rigs based on the smaller parts is surprising. (Yell if a quick primer on SMT construction will be useful. I reflow boards in a skillet on the kitchen range.)

I beg to differ, and I would invite you to think further on this topic.

An antenna is a coupling device. Its purpose is to efficiently "couple" or radiate your signal into another transmission medium (open space, including our atmosphere).

The antenna (effectively an inductor) needs to be resonant at your operating frequency of choice. It seems to me that the density and composition of the transmission medium you're coupling to has an effect on any antenna's resonant frequency.

This, to my understanding, means that an antenna designed for use in open air will not work underwater, nor will, say, a VLF antenna designed for submarine usage work in open air.

If you believe I'm misunderstanding, then please point me to some documentation on the subject, and I will cheerfully STFU.

Keep the peace(es).

I'm sorry you feel that way.

You know nothing about me, nor my work environment, nor how MANY
undercover cars have had issues with glass mounts.

This didn't just happen on one vehicle. It was on several. And my
own personal experience with glass mounts (yes, I tried using them at
one time myself) was terrible.

The big problem with glass mounts is their lack of a decent ground
plane. They spew RF all over the interior of the vehicle they're being
used on, hence the interference that I and others have experienced.

Perhaps you're the one who had best stick to "painting."

Just curious. Do you recall how much the windows were tinted? I
suspect one of the many reasons for problems is the tinting medium
in/on the glass.

Not really. The power going into the antenna isn't a "signal", but the power leaving it is. An antenna is a transducer -- it changes power in the form of electrical voltages and currents into electromagnetic E and H fields.

> The antenna (effectively an inductor) needs to be resonant at your
> operating frequency of choice.

That's completely untrue. There's nothing magical about resonance, and a resonant antenna radiates no better or worse than a non-resonant one.

As for being an inductor, the impedance at the feedpoint of a small loop antenna is inductive, but an antenna in general certainly aren't "effectively an inductor".

It seems to me that the density and
> composition of the transmission medium you're coupling to has an effect
> on any antenna's resonant frequency.

The conductivity, permittivity, and permeability of the medium in the immediate field of the antenna have a profound effect on the antenna's resonant frequency. Density in and of itself doesn't.

> This, to my understanding, means that an antenna designed for use

It certainly won't work the same as it does in the very different medium.

Any basic antenna text will do. Kraus's _Antennas_ is a good starting point.

Pity you snipped your original statement:

"SWR = Standing Wave Ratio. Put simply, it has to do with how good
of a load the antenna presents to the transmitter, and how efficiently
it will couple the transmitter's energy to the atmosphere."

Roy has kindly addressed the antenna aspects. But because you snipped, the
essence of my comment was cut adrift. A nice 50R resistor will not "couple the
transmitter's energy to the atmosphere" at all efficiently, but should certainly
provide a rather good match to your 50 ohm line. You should not attempt to
equate radiation efficiency with line matching.

I suggest you need to think further, or stick to plumbing.

Carson's Rule:
The required filter bandwidth for accurate recovery of an FM signal is (2*deltaF) + (2*Fmod).

Assuming from the requestor's previous that deltaF = 2.5 khz, and assuming that the highest audio frequency is 2.5 hHz, then the required filter bandwidth is 7.5 kHz. Whether this filter will reject the adjacent channel is another matter.

Mike:

There have been a few very interesting SMT transceiver kits with limited production runs, including KD1JV's ATS series. Nothing much about them on his website now.

http://kd1jv.qrpradio.com/

There's quite a bit of info on the ATS-3 at http://www.ae5x.com/ats3.html .

Another recent one is the NorCal 2030 (supposed to have a pretty good RX), see

http://www.norcalqrp.org/nc2030.htm

These limited edition kits area usually announced on the QRP-L email reflector.

The MFJ "QRP-Cub" transceivers are partially SMT and have 2 W output. But the kit version has all the SMT parts already mounted so you miss out on the kitchen fun !

73,
Steve VE3SMA

Much cheaper sources of better electrolytes exist. Using free scraps and
substances will produce a theoretical battery much sooner than a practical
one.
I sense that this discussion is being propelled by the desire to get
something for nothing or very cheap. If you do your homework, you may be
able to match the materials available to the desired output, and get
something safe and practical, but I doubt it. I'd be as interested as
anyone to see the results if you're successful.

Why do you think it was mostly dry cells and dynamos a century ago? Don't
you think they experimented with every metal and electrolyte available
before coming up with the lead-acid battery and the dry cell? If you're
keen to repeat history, have fun.

If the professor couldn't build a crude radio transmitter with all the other
advanced technology he managed to build, he wasn't a very good professor.

506. For the newly interested - The Weekly FAQ, "What Is Ham Radio?"

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-13 17:45:01 UTC
From: Orator For Decency <radio.ham@lycos.co.uk>
Message-ID: <1137174301.633511.266870@g47g2000cwa.googlegroups.com>
Source record: 14407
Cross-posted to: uk.radio.amateur,rec.radio.amateur.homebrew,rec.radio.amateur.policy

What is Ham Radio?

(Preface)
It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery. Even
the Usenet newsgroups dedicated to the cause have degenerated
into a hotbed of abusive onslaughts by those who ought to know better.
However, there still exists the fundamental basis on which Ham
Radio is based, and that will never die. This FAQ ("What Is
Ham Radio?") will be regularly published and will not be
shouted or bullied down. It is important that those of a
technical bent, who are the natural seed-corn of Radio Hammery
and who gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_
to you to exert yourselves to join our fraternity! (If you find
otherwise, then perhaps you are already classing yourself in the
mediocre groups of those who are criticised in the FAQ and from
whom we _MUST_ dissociate? If so - it's never too late for
a re-taxonomisation on your part - there's nothing elitist about
us, and we welcome all those who are prepared to put themselves
out in order to join our ranks!)

-----ooooo-----
(Article)
So,.....What is Ham Radio?

Ham Radio is a technical pursuit for those who
are interested in the science of radio wave
propagation and who are also interested in the
way that their radios function. It has a long-standing
tradition of providing a source of engineers who
are born naturals.

Ham Radio awakens in its aficionados a whole-life
fascination with all things technical and gives
an all-abiding curiosity to improve one's scientific
knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience
with ones fellow man, and shows itself in the
gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that
they can construct and operate their own equipment! No-one
else has this privilege. Users, such as broadcasters,
the po lice and armed farces, CBers and mobile phone
users have to purchase ready-made gear. Manufacturers
are not licensed to operate their gear. Radio Hams
are qualified to design, build and then
operate their own pieces of equipment. They do this
with gusto, and also repair and modify their own
equipment. This is a privilege well worth the effort
to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with
relatively simple technologies at first, perhaps making
his own Wimshurst machine and primary cells. Small pieces
of test equipment follow, possibly multimeters and signal
generators. Then comes receivers and transmitters. It is with
the latter that communication with like-minded technically
motivated people takes off. The scope for technical
development grows with the years
and now encompasses DSP and DDS. There is also a great deal
of excitement in the areas of computer programming to
be learnt and applied.

The technical excitement motivates Radio Hams to compete
with each other to determine who has designed and manufactured
the best-quality station. This competitiveness is found in DXing,
competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a
desirable thing to have that there are large
numbers of people who wish to be thought of
as Radio Hams when, in fact, they are nothing
of the kind! Usually such people are a
variation of the CB Radio hobbyist; they buy their
radios off the shelf and send them back to be
repaired; they are not interested in technical discussion
and sneer at those who are; they have no idea how
their radios work inside and have no wish to find out;
they are free with rather silly personal insults;
they have not satisfied any technical qualification
and their licences prevent the use of
self-designed-and-built equipment.

These CB types engage in the competitive activities
with their Cheque-Book-purchased off-the-shelf radios
in a forlorn effort to prove that they are Radio Hams.

No _REAL_ Radio Hams are deceived by such people!

-----ooooo-----

One such CB type is the so-called "Not-Ham". Otherwise
known as the CBer-Masquerading-As-A-Radio-Ham, this type
had their background in the hobby that is CB Radio and not
in the technical pursuits that lead up to a coveted Ham licence.
Easily recognised by their boasts of the criminal activity of
11 metre SSB operation, one wonders why they don't go back to
the CB Bands if such bands are dearer in their hearts than are the Ham
Bands? No _REAL Radio Hams associate with those who made an
illegal installation of transmitting equipment before being
in possession of an appropriate licence.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist
from the _REAL_ Radio Ham is to solicit their view of the
difference between CB Radio and Ham Radio. A Radio Ham will
perceive Ham Radio to be a technical pursuit and will
perceive CB Radio to be a social communications facility
no different in essence to a land-line telephone or a
GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
could also hold a CB licence safe in the knowledge that
such a licence says no more about him than having a land-line
telephone, whilst continuing to regard Ham Radio as a separate
technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between
a Ham Radio licence and a CB Radio licence. To him, they are
sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then
tries to classify himself as the equal of the Radio
Ham when, in fact, he is nothing of the kind. A sure sign of
a CB Radio hobbyist is if he holds, or has ever held, a licence
issued under the gangrenous degeneration that is the
M3/CB Fools' Licence scheme.

-----ooooo-----

One group of people who claim to be of the standard of
Radio Hams but who are in reality nothing more than an
apology for the failure of a CBer are those class B
licensees who falsely proclaimed that they were against
the use of a Morse Test to control access to the HF
bands, until, that is, a test was introduced at their
intellectual level, the intellectual level of 6-year-olds.

6 year-olds simply lack the mathematical tool kit to
enable them to handle even the simplest algebraic manipulation
for Ohm's Law and thus, the disgraceful Class Ber's in
the aforementioned category are not Radio Hams by any stretch
of the imagination!

Remember - A sure sign of a CB Radio hobbyist is if he holds,
or has ever held, a licence issued under the gangrenous
degeneration that is the M3/CB Fools' Licence scheme!

That's not too far off. :) We're all somewhat mislead by the assumed complexity. After all that we've read and thought, it's not easy to accept on faith that reflowing doesn't have to require carefully controlled equipment and expensive stencils. For now, consider only that hand soldering is much more stressful to the parts than almost any other (mis)treatment. Uneven heating; uncertain temperature rise; solder bridging and subsequent rework and more heat stress; ... on and on. On that basis alone, stir-frying is already a huge improvement. At its best, it isn't very far from a more stringently controlled process.

A few pictures of it working will help make the point. I had every intention at the onset of taking a few, and plotting temperatures taken with an IR thermometer. After doing the first board, though, the whole process seemed as obvious as noting that a rock will indeed drive nails. Or something like that. Bear with me.

The temperature profile is likely the major concern in your mind. Here's an example of a profile: http://www.stencilsunlimited.com/solder_products.php. Click on the link for "SynTECH Technical Data Sheet". The profile is on page 2. (Incidentally, their prices are among the lowest I found for small quantities. Less than $25 for a 35g syringe shipped. I use their 63/37 paste.)

There are two important control points: flux activation at 140^C, and reflow at 220^C. Flux activation is easily recognizable by the gray crud that forms on the paste. Reflow is also obvious from visual cues: the paste turns silvery and looks like molten solder. All that's needed now is to control the time.

Medium flame on my kitchen range is just about right for my thick bottomed aluminum skillet. Flux activation "happens" in a little less than 2 minutes. Reflow starts about 2 minutes later. When the last bit of paste turns silvery, cover the skillet, count to ten slowly, and then turn off the flame. Let it cool undisturbed.

The rest of it is putting on the paste and populating the board. You don't need a stencil to do that. Just draw a neat bead along the pads. The parts center themselves when it reflows. Compare that to the contortions of holding an SOT23 in place to solder by hand.

There is a difference in how you plan your work. Since you can reflow only once without special pastes and finer control, everything has to go on in the 6 hours the paste remains workable. The NorCal 2030 probably shouldn't be your first project.

Anyway, stir frying works well and easily with very few critical details. Try it on a scrap board first to "calibrate" the stove. Within reason, a little too hot is better than not hot enough, and a little too much paste is better than not enough.

Do you just sit the board on the bottom of the pan, or do you space it
up? Can you do double-sided boards? What else didn't I ask?

I've seen the web sites showing how to do toaster-oven reflow -- have
you tried that?

an alternative would be using TVSat 75ohm cable & connectors properly
lenght cut to mirror Z from source 50ohm to antenna (taking care of
cable velocity factor & unpair 1/4 multiple wave lenght proper cut);
this way is cheap ...

Actually, yes, they were. And you're right -- Tinting which has
metallic content is one of the worst offenders.

I can't be certain whether the tint on these specific cars was
metal-bearing. I just know that I've always had problems with glass-
mount antlers, no matter if the window is tinted.

Keep the peace(es).

I thank you for your opinion. I would also remind you that there's no need to be insulting. A simple "I disagree, here's what you might want to look at" will do.

Consistently telling someone to "stick to" one thing or another is more likely to get you dropped into a filter file, and subsequently ignored, than it is to get you listened to.

> Can you do double-sided boards?

There's just the slightest curve on the bottom of the skillet so it sits on its corners. I don't believe this is critical. Direct contact on the face will probably work just as well.

Components on the top-side only. You'll need to use a different paste if you need to reflow top and bottom, and definitely need tighter control on the temperature for the second side. An uncontrolled skillet won't do for that. Use a tin/silver paste for the first side. Its higher reflow temperature will allow you to reflow tin/lead on the second side. You'll want to use stand-offs in a properly controlled oven for that.

> What else didn't I ask?

Hot air is an alternative. I use a Weller Portasol with hot air nozzle for small rework. I hear of others replacing the rubber bulb on a Radio Shack desoldering iron with an aquarium pump. It takes longer to build a board, but might suit the pace of a homebrewer better.

> I've seen the web sites showing how to do toaster-oven reflow -- have you
> tried that?

I haven't tried using a toaster oven. The concepts remain the same, however. There might be a difference between heating with IR elements and heating the board more or less directly.

I used an on the glass mount on the rear window of my TA . Part of the
tinting has a metallic content, but was in the form of little circles
or dots. The rest of the window had a dark tint. The antenna worked
fine.

Prior to that I used one on a Thunderbird with no problems although it
did get out better on the TA.
>
> I can't be certain whether the tint on these specific cars was

>mount antlers, no matter if the window is tinted.

They have always worked well for me and generally you can tell by
looking at a tint whether it is metallic or not. They "look metallic"
with a silver tint. I've not seen any of the tan, green, or brown
tints that were metallic.

I ran a TM-D700 and a TM-V7A running 50 watts on 144 to these with no
problems. They didn't seem to mind the higher SWR on 440 and did well
there too.

I currently use a diamond mag mount with a colinear on top of a SUV
and that is a real performer.

Message-ID: <pan.2006.01.14.14.23.09.79553@oceanfree.net>
Source record: 14430

I am writing a simple program to design crystal ladder filters
using the formulas from W7ZOI's excellent QST article A Unified
Approach to the Design of Crystal Ladder Filters. QST May 1982.

I have got the tables of normalised coupling constants for
Butterworth and 0.1dB Chebyshev filters from the QST article.

I would like to find a source of similar tables for
filters with more than 5 poles and for passband ripple
other than 0.1dB.

Many Thanks.

Dear Chaps in the UK:

The hate and discontent just spewed upon you per the nickname of "an_old_friend" is none other than Mark C. Morgan, KB9RQZ.

Mark is quick to call others "bigot", among other things, however as it turns out he is the most aggrevious example of what a bigot really is. In this case, suggesting that those of you posting from the UK about license issues (a policy matter if ever I heard one) was somehow inapproprate on RRAP.

There is no prohibition in the RRAP "charter" about such messages being ONLY related to FCC (ie: "United States") jurisdiciton. I for one am interested in seeing how y'all perceive such issues and handle them.

Furthermore, he certainly does NOT hold any "moderator" status that would permit him to direct ANY discussion in this forum.

As for Mark...well...Mark is an enigma even here in the States. "Mark" is what happens when you spend more on one B-2 than you do on your entire nationwide in-patient mental healthcare system...A system that he'd be in if it were better funded.

Mark's tales started with his insistance that he was a drafted colonel in the US Army "chemical corps" (we was 8 years old when the draft ended in the States). He's recently been responsible for spamming RRAP with over 1000 messages and using the names of deceased family members of this respondant's family in order to "get a point across".

I am sure you know what "point" got across! ;)

So, please accept one Yank's apologies for the discourtesy and incivility exercised against you by one of my (less well cultured) countrymen.

Source record: 14432

In the '50s, as a teenager, I built a RF conversion receiver. You connect it to an antenna and an AM radio tuned to 1500KHz. Then you can explore the various bands above the AM band.

I have posted images of this item on alt.binaries.schematics.electronic

From the picuture, you can see a bandspread tuner in the center, a tuner at the left and an antenna coupler tuner to the right. It uses two 6J6 tubes and one whose markings I can't make out.

I built it from a schematic in either an ARRL Handbook or Radio-TV Electronics.

I wonder if anyone can identify this converter and provide me with a schematic. It's just for nostalgia's sake.

Al

I like many of you had my first experience with electronics through the electronic kits that Radio Shack has had over the years. The versions that spanned the 50, 100, 200 electronic experiments all come to mind.

My question is...how many versions and types of these kits have they had over the years?

I would be interested in hearing which ones you recall.

Thanks

TMT

I think they had a 250, it had a neat plastic case with a hinged lid, and
controls, displays, meter and speaker on the front of it.
I still have a 150 that I have had for 25 years.
The good ol' days of Radio Shack, when they were actually a good source for
hobbyists. Now they are not much more than Best Buy wannabees.

Hello Michael,

> The good ol' days of Radio Shack, when they were actually a good source for

>

But why is that? Many kids aren't creative these days. They hang out in
front of the TV or some video game but don't actually build stuff.
Places like Radio Shack as we knew it from the old days can only survive
when people built stuff.

The Radio Shack here in town has closed. It become a cell phone store. Sigh.

Hi...

Wow, memories again! :)

Bought one for my daughter about 25 years ago. Though she's been
grown and gone for a good while, it's still intact and sitting on
the top shelf of her closet (her closet here). Just looked at
it - it's a 150 in 1. Radio shack part number is 28-248.

Anyone's interested I'd be happy to scan some or all of the experiment
pages and make them available.

And about 5 years ago bought one (used) off ebay for the young
fellow a couple of doors over birthday. I think he's still
enjoying it. One of his favorites was a rain detector project.
Figured out that if he wanted to know if it was raining, all he had to
do was put it together, carry it outside, hold it up for a while,
and bingo! Knew whether it was raining or not :)

Just for curiousity looked on ebay, searched electronic kit,
and the first thing that came up was one :)

Take care.

Ken

I'm not going to try to address any or all of the issues as to market needs, pay scales, bla bla blah - but I will say - I suppose these kids today - think those video games and so on - appear out of no where. Yes, maybe they can program something on a computer to do that - but they should try tackling the "component" level stuff. Actually learn what it takes to do all that. There are probably a host of reasons we could bring up as to "why" they don't - but it doesn't necessarily have to be that way. Even miniaturization goes so far..... if the demand for the larger parts such as we're used to working with would increase - maybe the action would pick back up.

As to the kits and Radio Shack, I learned from their books. My father bought me like a 50 in 1 kit from Lafayette Radio - I think! Back then, Radio Shack hadn't gotten in our area yet. BUT then when they did, I bought every book they had. I've had technical training since then and went beyond that. I build items from junk parts just to have something to do when not repairing. It is a very enjoyable hobby. I went to a Hamfest this past summer and someone gave me a 150 in 1 kit with a book. I have other items here which have power strips and so on - but you have to supply the parts yourself. But still - makes for a lot of designing fun.

That's true, I guess the electronics hobby just isn't as big as it was in the late 70's-early 80's. You would think kids would at least have some curiosity about how the game controllers work, or how to build a power supply to run their GameBoy to save the batteries. Of course, you can buy a power supply for a fraction of what it costs to build one from scratch.

The really sad thing about the RS kits is they failed to explain to the
novice user how the components acted together to make the circuit
function. Instructions to insert the + lead of C4 into hole 4-12 did
nothing to educate the user about electronics. Once the novelty and
interest in the buzzer and LEDs flashing waned, the user departed, non
the wiser and no more knowledgeable about electronics than when they
started.

Hi Lou, long time no see.
I don't think they "thought" anything. Just filling a niche marketing wise. Lots of kids have an interest in something new - not necessarily something specific - and the only way for a parent to capitalise on what might be a budding ambition would be exposure to something like this kit rather than just disassembling the family's clock radio.
Anybody who has raised a kid who wanted to be a "musician" in the school band at about 7th-8th Grade knows what I'm talking about :)
Hehe...I remember my "chemistry set". It actually had instructions about how to make a stink bomb. That didn't turn me towards being a chemist but the exposure to all that stuff at least gave me some cognizance of what it was all about at an age when I knew absolutely zip about chemicals. Not that that has changed any in the past 40 years !

-Bill

Yeah Bill, long time no see - "trying" to stay out of trouble! :) Anyway, you are probably correct. I was "trying" to give them the benefit of doubt. Chemistry sets - eh? Man, my bedroom was a mini lab. If I had now - what I had then - they'd arrest me on suspicion of a Meth Lab or something. Man, I had a telescope, microscope, geology set, chemistry set, jars of formaldehyde (sp?) with specimens in it, and so on. Not to mention the electronics crap I had a ton of. I barely had room for my clothes, bed and other eh - more important stuff. Ya know - looking back - I miss all that..... That was FUN..... Half the so called Chemistry sets and so on now - don't have half the goodies the sets did back then. These new sets are garbage compared to what we used to get. Same with the new project kits. JUNK..... Knowing what we had, maybe there is a reason these kids would be bored. Somewhere, I think I have a couple pictures of my Lab - er - I mean Bedroom.

yabbut...remember how cool it was to imagine a little thing that
actually worked that you could stick in your pocket and if you punched
in about 10 switches you could talk to ANYBODY IN THE WORLD?...and have
them deliver a pizza?

Hey, how do you keep 'em on the farm once they've see the city?

I imagine back in the 50s-60s the old farts were grumbling like we are
now about having those spoon-fed kits for those (us) unimaginative kids.
It all works out in the long run. There's 14-year-old kids with rooms
stacked full of old curbside PCs and video cams that would scoff
(technologically speaking) at us old guys who were limited to stink
bombs and dead salamanders in jars.

They'll be ok...at least some of them will...and thats the way it has
always been.

555. Crystal Filter Matching

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-15 09:10:56 UTC
From: David <webreply@orbitcoms.com>
Message-ID: <Akoyf.217626$V7.210436@news-server.bigpond.net.au>
Source record: 14356

I am wanting to place a 45MHz, 2-pole crystal filter between the first mixer output and 2nd IF input. (Mixer output is a SA602 and IF input is SA605).

The mixer output is around 1500 Ohms and the IF input is around 4500 Ohms with 2.5pF capacitance parallel.

The required source and termination for the filter is 800 Ohms par with 3pF. The insertion loss of the filter is 2dB max.

Would the impedances be close enough to use resitive pad between mixer and filter (680R in series with 1k2) and a small cap to ground across the filter input.
Then a 980R resistor to ground at filter output and no capacitance (use SA605 2.5pF and stray to make up the 3pF).

This would give total loss around 4.7dB.

Or would I be better to use say a tapped capacitor or L match from Mixer to filter with
added C on filter input.

Apparently the SA605 has a "swet spot" for noise at around 800R so maybe the Res to ground on the input would be ideal ???

Thanks for any help, I have not used crystal filters before and unsure of implications of the approach.

Regards

David Huisman

Hi Kevin:
the main reason you didn't find one is the glass losses!
at 2.4GHz, the loss of most kinds of glass winshields are made of, is so hi as to defeat operation!
using a different base, such a cellular one will work, since it has a high pass filtering characteristic, but like I said, the glass itself can prove to be an insurmountable hurdle.

Xtal filters are designed to operate correctly between specific values of generator and load resistances. Trying to "match" the input and output impedances almost always degrades the filter frequency response. Xtal filters are rather strange in that respect because of the complicated things that go on inside.

Transforming the generator and load resistances to 800 ohms using L networks is an excellent idea. Add the 3 pF that the vendor suggests.

My hobby began in 1973 when I got a Thomas Salter Electrical Lab 4 for
Christmas.

I got one of these 150-in-1 IC experimenters kits for Christmas in 1974:
http://www.transistor.org/collection/lafayette/lafayette4.html

The UK version wasn't badged "Lafayette". Regrettably, I trashed it for the
parts many years ago, although I still have the wooden case.

The "imagination barrier" blurs when TV shows like the old Star Trek
"predict" Motorola flip-phones.

> I imagine back in the 50s-60s the old farts were grumbling like we are
> now about having those spoon-fed kits for those (us) unimaginative kids.

I had it both ways- I was given everything from Erector sets through
chem to electronic sets, AND had an Elmer down the street who showed me
how to make working stuff out of "junk".

OTOH my mother just couldn't understand why I thought it necessary to
disassemble my "perfectly good" microscope...

Sorry, all sound cards that I know of are AC-coupled, with a roll-off
in the few Hertz range (or above). So you won't get anything like
a DC step unless you are talking about very short durations. (Few
msec or so.) Longer durations will have more and more noticeable
tilt as the input coupling capacitors charge up. If you are only
using this as an auditory stimulus click, say, for evoked potentials,
it probaby won't make any difference because you couldn't really
hear the DC anyway, just the transitions. But if you are trying to
(say) drive a solenoid to whack a resonant structure, you will need
some external interface.

Tell us more about what you are trying to do.

What I remember most about them is the wide variety of different types of kit, and the garbage quality of the circuits in the books. ISTR the components strung between springs type were popular and cheap, I also saw one with square plastic cubes that each contained a part, and they all slotted in next to each other to make circuits. And the Philips ones that were a PCB with components mounted on bolts which screwed to the pcb.

Best thing to do with the spring ones was to rip out the parts, then you got twice as many connection points to use, just string parts between the springs instead of wires. Add some more springs, which is easy enough, and you could start building more serious projects with them, eg radios that worked properly, burger alarms, etc.

From your question, I wonder if you have any idea what a PITA Windows
development is -- especially when it relates to dealing with hardware at a
low level.

> Sorry, all sound cards that I know of are AC-coupled, with a roll-off

I've never studied them, but I would expect this to be the case. And even
if it were not, I can't imagine why the DAC would be designed to support DC

Absolutely! Learning does not occur unless there's a failure that you
must analyse and understand. Flame makes it sink in even more ;-)

I estimate that I have torn up at least 20X as many sheets of paper as
I have kept.

They were good for getting down to the fiddly bits (for those of us
who survived the mains wiring etc with breath and fingers intact).

Besides, I believe I recounted some of my "teleportation experiences"
with mains voltage in my youth. That sort of thing can be misconstrued
as a religious experience, but I was lucky, I guess...

start from using the lpt port not a sound card. you can also use com port control signals like dtr, rts, cts for i/o. you will probably have to provide a signal level converter in any case. there are also control cards, mostly for industrial or scientific applications, that provide digital and analog input and output... or there are usb devices that do the same thing for remote control or data collection. and if you are trying to control household stuff check out the x10 computer control interfaces that are pretty reasonable.

When I got my electric train set, I quickly found that the spring from a
ball-point pen would glow red hot when placed across the track wire
terminals of the control box.

>had over the years?
>
>I would be interested in hearing which ones you recall.

I only recall that Radio Shack had them, probably over many
decades. I never owned one.

But I don't feel particularly deprived - when I was about five to
six years old I got a Heathkit version of these "N-in-1" kits. I have
no clue of the model number, but I think it had:
one transistor,
one diode,
one variable coil (magnetic material on the end of a small threaded
rod that went into the coil, you turn the end of the rod to 'tune' it
- common then, I don't see them nowadays)
several capacitors and resistors
small crystal earphone
I recall that it used small compression springs to accept the
wires, and Fahnestock clips to connect to things off-board: earphone,
antenna and ground. Or perhaps it used only springs, but Fahnestock
clips were common connectors for these projects.
There were two radio projects, one with the diode, and one with the
transistor. The one with the transistor was of course much more
sensitive and played louder through the earphone.

I later recall having another brand, a 'more advanced' model on an
actual printed circuit board (there were traces between each
component's leads and the clips or springs on the board), perhaps it
was a Knight-Kit. It had a relay, a silicon photocell, probably two

transistors, and the usual passive components.

577. GOOGLE SECRETS ..earn easy money

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-15 19:51:29 UTC
From: J Dee <saso@hotmail.com>
Message-ID: <1137354689_4477@sp6iad.superfeed.net>
Source record: 14378

I was browsing these newsgroups, just like you are now, and came across

an article similar to this that said you could make thousands of CASH
within weeks with only an initial investment of $6.00 plus stamps! So I

thought, "Yeah, right, this must be a scam!" But like most of us I was
curious and kept reading. It said that if you send $1.00 to each of the

6 names and addresses listed in the article, you could make thousands
in a very short period of time. You then place your own name and
address at the bottom of the list at #6, and post the article to at
least 300 newsgroups. No catch, that was it.
So I invested six $1.00 bills and six 32 cent postage stamps ... and
boy am I glad I did!!! Within 7 days, I started getting CASH in the
mail! I was shocked! I figured it would end soon and didn't give it
another thought. But the CASH continued coming in. In my first week I
made between $20 to $30. By the end of the second week I had a made a
total of $1,000.00. In the third week I had over $10,000.00 and it was
still growing. This is now my fourth week and I have made a total of
just over $42,000 and it's still coming in ..... It's certainly worth
$6.00 and 6 stamps !!! Also, make sure you print a copy of this article

NOW, so you can get the information off of it as you need it. I promise

you that if you follow the directions exactly, that you will start
making more CASH than you thought possible by doing something so easy!
Suggestion: Read this entire message carefully! (print it out or
download it.) Follow the simple directions and watch the CASH come in!
It's easy. It's legal. And, your investment is only $6.00 (Plus
postage) IMPORTANT: This is not a rip-off; it is not indecent; it is
not illegal; and it is virtually no risk - it really works!!!! If all
of the following instructions are adhered to, you will
receive extraordinary dividends. PLEASE NOTE: Please follow these
directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days.
This program remains successful because of the honesty and integrity of

the participants. Please continue its success by carefully adhering to
the instructions. You will now become part of the Mail Order business.
In this business your product is not solid and tangible, it's a
service. You are in the business of developing Mailing Lists. Many
large corporations are happy to pay big bucks for quality lists.
However, the CASH made from the mailing lists is secondary to the
income which is made from people like you and me asking to be included
in that list. Here are the 4 easy steps to success:
STEP 1: Get 6 separate pieces of paper and write the following on each
piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00

bills and place ONE inside EACH
of the 6 pieces of paper so the bill will not be seen through the
envelope (to prevent
thievery). Place one paper in each of the 6 envelopes and seal them.
You should now have 6 sealed envelopes, each with a piece of paper
stating the above phrase, your name and address, and a $1.00 bill. What

you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are
requesting a legitimate service and you are paying for it! Mail the 6
envelopes to the following addresses:
#1) Barry Hewison
1222 Louisa ST.
Watertown WI 53098
#2) David Hall
19855 Deercreek DR.
Zachary LA. 70791
#3) P Sewak
6 John Warren Avenue
Glenwood NSW 2768 Australia
#4) S James
#34 - 7611 Moffatt Rd
Richmond BC V6Y 1X9 Canada
#5) J Johnson
201 Dames Road
London E7 OEA
England
#6) S Wize
43A Portnall Road
London W9 3BA
United Kingdom

STEP 2: Now take the #1 name off the list that you see above, move the
other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as
number 6 on the list.
STEP 3: Change anything you need to, but try to keep this article as
close to original as possible. Now, post your amended article to at
least 300 newsgroups. (I think there are close to 32,000 groups) All
you need is 300, but remember, the more you post, the more CASH you
make! Keep a copy of these steps for yourself and, whenever you need
CASH, you can use it again, and again. PLEASE REMEMBER that this
program remains successful because of the honesty and integrity of the
participants and by their carefully adhering to the directions. Look at

it this way. If you are a person of integrity, the program will
continue and the CASH that so many others have received will come your
way.
NOTE: You may want to retain every name and address sent to you, either

on a computer or hard copy and keep the notes people send you. This
VERIFIES that you are truly providing a
service. (Also, it might be a good idea to wrap the $1 bill in dark
paper to reduce the risk of mail theft.) So, as each post is downloaded

and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches

the #1 position you will be receiving thousands of CASH in CASH!!! What

an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business!
DIRECTIONS FOR HOW TO POST TO NEWSGROUPS
Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this letter, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of

the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you'll always have this file to go

back to.
Step 4) Use Netscape or Internet explorer and try searching for various

newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!
REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 300
That's it! You will begin receiving CASH from around the world within days! You may eventually want to rent a P.O.Box due to the large amount

of mail you will receive. If you wish
to stay anonymous, you can invent a name to use, as long as the postman

will deliver it.
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT
Now the WHY part:
Out of 300 postings, say I receive only 7 replies (a very low example).

So then I made $7.00 with my name at #6 on the letter. Now, each of the

7 persons who just sent me $1.00 make the
MINIMUM 300 postings, each with my name at #5 and only 7 persons respond to each of the 7
original 7, that is another $49.00 for me, now those 49 each make 300

MINIMUM posts with my name at #4 and only 7 replies each, I will bring in an additional $343.00! Now, those 343 persons turn around and post the MINIMUM 300 with my name at #3 and only receive 7 replies each, I will make an additional $2401.00! OK, now here is the fun part, each of

those 2401 persons post a MINIMUM 300 letters with my name at #2 and they each only receive 7 replies, that just made me $16,807.00!!! Those 16807 persons will all deliver this message to 300 newsgroups with my name at #1 and if still 7 persons per 300 Newsgroups

react I will receive $117,649.00! With an original investment of only $6.00! And some stamps. AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday? JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out

and no one sends you the CASH? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will really work. ** By the way, if you try to deceive people by posting the messages with your name in the list and not sending the CASH to the rest of the people already on the list, you

will NOT get as much. This is the fairest and most honest way I have ever seen to share

the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future CASH. Make sure you print this article out RIGHT NOW! Also, try to keep a list of everyone that sends you CASH and always keep an eye on the newsgroups to make sure everyone is playing fairly. Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the CASH!! GOOD LUCK to all and please play fairly and reap the huge rewards from this,

which is tons of extra CASH. Please remember to declare your extra income. Thanks once again... "People have asked me if this is really legal. Well, it is! You are using the Internet to advertise your business. What is that business? You are creating a mailing list of people who are interested in home based computer and online business and methods of generating income at home. Remember, people send you a small fee to be added to your mailing list. It is legal. What will you do with your list of thousands of names? That's up to you." So, build your mailing list, keep good accounts, declare the income and pay your taxes. By doing this you prove your business intentions. Keep an eye on

the newsgroups and when the cash has stopped coming (that means your name is no longer on the list), you just take the latest posting at the

newsgroups, send another $6.00 to the names stated on the list, make your corrections (put your name at #6) and start posting again.
NOTES:
*1. In some countries, the export of the country's exchange is illegal.

But you can get the license to do this from the post office, explaining

the above statements (that you have an online business, etc. You may have to pay an extra tax, but that's OK, the amount of the incoming CASH is HUGE! And as I said, a few countries have that restriction.
*2. You may want to buy mailing and e-mail lists for future CASH. (Or Database or Spreadsheet software.)
*3. If you're really not sure or still think this can't be for real, please print a copy of this article and give it to someone who really needs the CASH, and see what happens.
*4. You will start getting responses within 1-2 weeks, it depends.

ALSO REMEMBER
SEND YOUR $1 OUT TO EVERYONE ON THE LIST,
EVEN IF THEY ARE NOT FROM THE U.S.
WHAT ARE YOU WAITING FOR???

Hi folks,

Problem is this, My old Panasonic CF-41 laptop works great with my GPS/APRS goodies, but the internal cd drive doesn't seem to want to read CDR's. This was a common problem with older 4x and slower drives. I suspect the internal drive is a 4 speed and working to original specs perfectly.

Have you found any CDR's that consistantly seem to work with old drives?

At home I hook my BackPack cd drive up to the laptop and all is well, but on the road that is not an option.

Thanks for any leads!

having dealt a bit with similar problem I think your problem may be
more with the controling software than the writing drive

XP esp is not a good choice

look for one the older cd burning programs and try bruning the at 1x
speed

I can't say 100%, but I've had good luck with the following techniques:

1. Use disks with a recording surface that looks yellow (aka "gold").
There are different dyes used and that seems to work the best.

2. Record at no faster than the read speed of the drive.

3. For some unexplained reason, the best luck I have had is with a DVD
burner (I've done it with 3 different ones, LG, Toshiba and NEC)
at single (CD 4x) speed.

4. Turn off any buffer overrun protection. It works by streching out the gap
between sectors and the new gap may be too big for older drives.

5. Always make sure you finalize the disk, close the sessions, fixate
(same thing different software).

6. A CD lens cleaning disk has saved many a drive for me. But I live in
the desert.

I've had great luck with TEAC blanks, they are marked 12x to 52x but they
do work at lower speeds.

Software issues:

I often burn my CDs and DVD roms using a combination of UDF and ISO
file systems. Older operating systems seem to have trouble with them,
limit them to ISO file systems. If you really get stuck, try turning off
rock-ridge and joliet extensions.

Good luck,

Geoff.

Mine was a RS Solar Power Kit. Not as many items as the *in1 kits, but
using the solar cells was cool.

While the instructions did not go into to too much detail on the why,
they did cover it at least a little. With the easy spring connections,
I would often switch things around to see what would happen. The
results were the most obvious with the sound experiments.

The important thing with the kits was that you at least learned what
different parts were called. Twenty five years later when my wife
wanted to build a Sinclar ZX81 we bought surplus, I got her a 150 in 1
kit first just so she could learn what the pieces were before she
started on building the computer since she knew nothing about
electronics when she started. The kits gave you confidence that you
could do this, even if you didn't completely understand what it was
that you were doing.

All the batteries? Then you'd better do that before Friday!

>> What materials would you use?

To fabricate a cell with dissimilar metals + salt water electrolyte you simply search in the sand for different bags of dubloons--and hope they came from batches of alloy sufficiently dissimilar to generate a worth-while potential difference. If not, then jump the next pirate who comes ashore and steal his sword: it's iron or steel. Use that as one of the electrode metals for your battery. But you can't escape the island in the pirate's rowboat, that would be against the spirit of adventure ....

You should have adjusted the circuit to detect only burgers above 80
degrees F.

Yes they should be, but you seem to have missed the point! With the laws today - the parents would be arrested immediately - in most cases for Child Abuse - and questions asked later. The answer of trying to teach them electronics probably wouldn't be a good answer now days. Many of those who made and uphold the laws either didn't grow up like we did - or - lead a very sheltered life and took very few chances.

It certainly wasn't my parents fault, I was a very inquisitive child. Hell, I stuck my fingers in empty light sockets and hit the switch and did many other stupd stunts - more than I can keep count of. But, I LEARNED. Back in those good ole days - Child Abuse may have been around, but parents weren't busted just for looking at their child - in a cross manner. THAT was living. Today - you have to watch anything and everything. I'm glad my kids are grown, now I don't have that worry.

What's your point?

Are you saying that you have spectrum analyzers (which you say are
garbage) that you want to get rid of, or are you saying that you'd
like someone to dump a spectrum analyzer into your garbage can?

Thanks for the links. The ATS3 looks promising, as do the DDS and SDR
directions. I'm pleased to find the fresh ideas making their way along.
Seeing the gulf between the old and the new, though, it makes you wonder
(yet again) where HF operating will be in another ten or twenty years. I
have half a mind to hibernate another year or so, and see where the "kids"
take us. :o

Hmm. I'm not sure how to design one that doesn't.

Usually, all that's necessary is to locate the output coupling
capacitors on the sound card and bridge them. This may be easier with
older Sound Blaster 16-era sound cards, before they all went to SMT.

With all due respect and being as polite as I can be, I disagree.

As far as I can see, Jim Thompson's outlook on life seems to me to
be that of a (according to him) polio victim who somehow managed to
mollify that disability (to which all of us who refused to succumb
to that illness should kow-tow) and then went on to achieve
semi-greatness by learning how to transfer circuits onto silicon.

Not a big deal.

Got a circuit which needs to be reproduced a zillion times?
Also not a big deal, no matter what you've been told.

Learning occurs on many levels, not the least of which is the
information which we're given when we're ignorant and _can't_
analyze the data given us.

I learned the names for red and green when I was very young, and I
still see them the same way and call them the names I learned back
then.

>

I believe most come with a wall wart type supply. After all, they pay
$300 or more for those gizmos. But that's just the problem, kids have
way too much money. We had to make do with whatever parts a discarded
radio or TV set yielded. And that was plenty. I remember jumping up and
down in joy as a kid when I found a 13.56MHz crystal in a TV. That
discovery propelled me into the ISM business.

Regards, Joerg

The OP posted that he was thinking of getting rid of his
spectrum analyzer, and was wondering if there was some inherent
use that, as a hobbyist, he might of missed.

#0 was a reasonable response to this request for information.

#1 says they are garbage in faint hopes of convincing the OP that
he should get rid of his spectrum analyzer.

#2 echoes #1, and offers up a garbage can for the OP to put his
spectrum analyzer in.

#3 plays the straight man, and wonders if the "really nice garbage can"
can do phase noise measurements.

#2 plays the comic, and implies that if someone puts a
spectrum analyzer (the right kind of garbage) in his garbage can,
then his garbage can will be able to make phase noise measurements.

Bah duh BUMP! (the sound of the ever present drum in the club band)

I didn't think that you would be so humor impaired that you would
miss the meaning of this simple thread. This is just plain old
ham banter the likes of which is heard daily on the informal nets
on the ham bands, or at hamfests everywhere.

I built one and still have it in a box, somewhere. Interesting unit,
at the time.

I suggest modifying a readily available sports radar, it is very sensitive,
outputs speed digitally and is inexpensive.

Then the next step is to post legal notice in the form a large sign.
"Private road. Right to pass under control of owner." And make sure that
you know just what ownership rights you have. If other owners attached to
the private road have equivalent ownership you could create problems for
your self. However, patterns of Bott's dots on the road also have
significant speed reducing effect and cases against them have usually lost
clearly. Also, rumble strips made by any method have been effective also.

Actually you can rent them for about $500/mo and set them any where you wish
on your private road. Look for roadway construction suppliers to find
them. You could probably buy one for under $10,000 and modify it with
cameras etc., to your hearts content.

> had over the years?
>
> I would be interested in hearing which ones you recall.

I recall my first electronics kit consisted of a single hair pin (U shaped
hair pin)
i promptly applied it to the nearest power source i could find (which
happened to be a 120v outlet) nothing happened at first so i proceeded with
my experimentation of wiggling the hair pin so as to make contact, i
remember the lights flickering and then i recall a loud scream imminated
from my general locale and the rest blurs

my second electronic kit was radio shack am radio with ear plug phone it
scratched out some noise and occasional radio signal

my third project was a shock box (pop-mech kit ?) where i dug up some old
transformer from my dads shop that resembled the one in the design (same
shape & number of wires) and i applied either 6v lantern battery or couple
of D cells to the indicated wires then self-tested the output... i have no
idea what i put together but my arm ached and felt like jello for a short
while after the test.

4th came the 100 or 125 kit from RS where you had to build some of the
elments/switches/ variable capacitor ? (eg. bunch of thin brass(copper)
sheets and some thin plastic wafered together with an adjustment knob?) i
remeber lights, buzzers (elec keyboard), meter ?,

I enjoyed it then but electronics interest faded quickly once the TRS-80,
TI-99-4a, timex sinclair, ataris and commodores etc became available for
play plus the video games of 70-80

Actually inductive loop detectors (buried or not) require fairly good wire to last more than a year. Plus you have to provide a roadside cabinet and detection electronics, and power therefore. of course you can space them carefully and detect speed that way also.

Sorry I did not explain better my meaning. This unit does not 'burn'
cd's at all, and I wasn't looking to do that. I have burned the CDR's
on my big computer and want to read them on the laptop, and the laptop
refuses to see most CDR's. It seems to read some of my older sony cdr's
however. They are shiney silver color, and it would make sense that
those are readable. Burning at 1X on my big computer seems to help.
The CDR's made on the big computer are 'good' if you want to say that
as everyone else with 8X or faster drives can read them fine.

Just looking for a more easily 'readable' CDR that my old laptop
may find easier to deal with. The laptop reads store bought 'master'
CD's just fine, music or data, it's the less reflective CDR surface
that trip this thing up.

You might want to try to find a supply of older-chemistry blanks which
are designed to be burned at speeds no greater than 4x or so, or even
the specialized "audio CD recorder" blanks (some of these are
optimized for burning at 1x). I've heard reports that these may have
a stronger recovered-signal level than newer high-speed blanks do
(thicker dye layer in the old variety??).

I've generally had good luck with Taiyo Yuden blanks. Used to like
TDK a lot - their "metal-stabilized cyanine" media seemed to be quite
good - but they seem to have stopped making their own blanks and are
OEM'ing from companies like Ritek.

IIRC, at least some of the Crystal/Cirrus data sheets for ADCs (and
codecs) indicated that there was a 3 Hz lower frequency limit,
apparently due to some DC offset drift compensation circuitry on the
chip itself.

Even if the sound card is AC coupled with a capacitor, various diode
clamping tricks can be used (as in clamping the sync tip to a known DC
level in video equipment).

I'm sure we've all had our turn at learning things the "hard" way back then. Some funny, some not so funny - at least not then - but boy is it nice to sit back and laugh at ourselves now..... But hey - we made it - and learned a lot along the way. IF we all admitted to all the things we did then, many would wonder how we either survived or weren't put in a looney bin.

> clearly. Also, rumble strips made by any method have been effective also.

In Hopkins, Minnesota, the main street is kinda S-shaped - it's impossible to speed, because you would be going over curbs. It's like, for a half a block, the sidewalk on one side is 6 feet wide, and on the other side it's 18 feet wide, and then the roadway curves, because in the second half of the block (except the transition), the 6' sidewalk on one side grows to 18', and the 18' side shrinks to 6', so if you're in your car, you have to turn, or hit the curb; it's terribly difficult do do this any faster than about 20 MPH.

But, admittedly, road-building is mind-bogglingly expensive.

Good Luck!
Rich

Geez, John, even _I_ got it! Guy A says, "My scope is garbage." Guy
B says, "I have a nice garbage can", which implies (at least it did

to me), "Go ahead and throw it this way!"

Admittedly, not the world's greatest humour, but I don't think it was meant to be taken so seriously as to spoil anybody's day. ;-)

Cheers!
Rich

IIRC, part of the original question was something like:

"Where/How can one learn to program soundcards?"

I, too, would be interested in the answer to that question.

Source record: 14281

0 These tiny collectable 1960s transistor sets seem to be available on ebay all the time.

1 First and foremost kudus to Wumpus who has posted an online pictorial on how to use modern zinc air hearing aid batteries in an SR-H436 ruby.

http://www.oldradioworld.de/srh436.htm

2. Based on this site, I tried using some hardware I had on hand and found that a perfect spacer was easy to make with #6 brass hardware: a 6-32 machine screw, eight thin flat washers, one hex nut. #6 sized brass is easy to machine: i.e. cutting down the screw length using dikes , and a steel 6-32 hexnut can be used as a die to clean up the threads on the brass screw after trimming it to length.

3. After a few successive trimmings of the screw, my spacer ended up (the assembled screw, washers, nut) to an overall length of .457".

4. My spacer does have the screwtip sticking out past the nut like it does in the Wumpus pictures. Instead the screw is recessed down inside the hexnut, so that the nut (instead of the screwtip) contacts the radio. Using more or fewer washers allows having the nut extend just slightly past the tip of the screw.

5 Using 675 (i.e. blue) hearing aid batteries I do not need the paper tubes which Wumpus shows. I just cut a strip about 5" long of gray duck tape .200" wide and wrapped it around the stack of washers on the spacer until that the diameter of spacer roughly equaled that of the batteries, this leaves the screwhead and hexnut extending out of the tape so they are not covered by the tape like the washers are.

6. I use no covering around the batteries (Wumpus used a paper tube) because the stack of two batteries and the spacer holds tight in the radio, and does not ever lose electrical contact as the radio is jostled. The longest part of battery replacement is unscrewing the radio cover with a disme, after that it takes 10 seconds to swap batteries.

7. The discontinued Eveready 640 size alkaline cells have a mAh rating of 325 and costed $5 each at Radio Shack.

8. #675 zinc airs are $36 including shipping for a case of sixty Toshibas at www.microbattery.com/. And these are rated at 651 mAh !

9. A couple hours ago my tiny SR-H436 picked up 20 listenable stations during the daytime, a dozen loud and clear, with good selectivity, very nice performer.

True story:

At the ripe age of 11, I received my first Digi-Key catalog (Dad was into electronics...). At the time I was big into neon lights (sad I know), and had collected lots of the little bulbs from Radio Shack, salvaged equipment, etc.

Digi-Key had bare bulbs for 11 cents each! And strangely, they were listed as requiring 120v (without a resistor specification, and not pre-attached resistors, assembly, etc). I had to have a couple, as surely these were exotic and unusual bulbs.

So I taped two dimes and two pennies to an index card, filled out the order form, and mailed the whole thing to Digi-Key, along with a personal note about how much I loved neon lights (yes, still sad).

Couple weeks later I got back a stern typewritten note about minimum orders, effort of fulfilling tiny requests, shipping charges, yadda, yadda... and enclosed in the envelope with this letter were two neon lights wrapped in bubble wrap!

I could not wait to test my new neon lights that didn't require a current limiting resistor. Still, something seemed ominous about that, so I enclosed the first one in a glass jar, "just in case". Applied 120V and POW, tiny neon bomb!

I sent the broken glass and freed electrodes, carefully padded and wrapped, back to Digi-Key with a nastygram of my own, stating what had happened and how these were NOT 120V neon bulbs despite the catalog specification. Couple of weeks later I received a reply in the mail, with an apology, a statement of catalog revision, and... a replacement neon bulb ;) .

Ah, Digi-Key, thou dost know customer service.

Thanks,
Josh

P.S. Hope this wasn't too off-topic.

it is stories like these that always make me wonder how lots of kids like that survived child hood

had a similar experiment story (similar age) mixing Acetylene and Oxygen from the torch into a small 16oz glass bottle then putting a match near opening to see what kind of flame would be produced :)

for some unknown reason (alludes me to this day) i decided to put it inside of a 5 gallon paint bucket and that was the better part of the idea

>
> --Myron.
>

It's kind of an open-ended question... one that depends entirely on what sort of application you want to build and what development environment you prefer to build it with. A quick and dirty console app to record a raw PCM audio file using the waveIn API will be on the order of 100 lines of C code. A more-sophisticated app that has to parse various sound file formats, handle streaming audio, or otherwise do a lot of network and/or UI interaction will of course be longer and hairier.

Either way, it's not necessary (or appropriate) to deal with low-level hardware coding, and in neither case are the basic programming concepts obscure or difficult. The Win32 APIs for audio input and output -- namely waveIn, waveOut, and DirectSound -- have been around forever, work very reliably, and are very well-documented.

A good first step is plugging phrases like "sound programming" into your favorite search engine, tweaking the search terms based on the language and intended application. Once your questions become more specific, there are a lot of ways to get help with them.

They knew you might grow up to be an engineer and design something that uses millions of dollars' worth of their parts.

RCA and Kodak were very generous to me with documentation and answers to questions when I was young. Sadly, RCA died before I could do anything to repay them. Kodak is still there and has benefited, I think, from some writing I did in the 1980s.

same could be said of most hams!! I bought an HT recently and I was
astounded to learn HRO did NOT stock SMA connectors (needed for the HT),
or RG174.

Hams pay $30 to $60 for coax with BNCs at each end. Hams pay $30 for
12VDC 200mA wall warts! Hams pay $15 to $30 for serial cables.

do hams actually BUILD anything these days?

Mark, you are INCAPABLE of even the most basic of reasoning, let
alone analysis.

As for being "sexaul" obsessed with you, that's your OWN fantasy.
Enjoy.

Sure I can. And I did in that very sentence above.

No, I do not "always" claim you're drunk...That's only when you
ARE drunk. it's apparent in your postings.

I do, if I find something worth the effort. It is fun..... I don't mind
building, including making my own PCs, but it has to be something which I
can use - not just throw in a drawer once done - never to see daylight -
again. I've built some pieces of test equipment which saved me a lot of
aggrivation and time - once completed. Heck, I wish I could do a project a
week - just to do it.

So what? Although I understand your point here -- you'd like people to build their own equipment and learn a few skills -- I would sure hope that anyone who's been messing around with electronics since a kid has terminated hundreds or thousands of cables, built plenty of cheesy wall-wart-like power supplies, and wired plenty of their own cables. If they're smart, they've advanced their skills well beyond the point and now have good paying jobs and buying those pre-manufactured items is arguably a much better use of their time than making them.

It just doesn't make sense to build your own power supplies when you can buy something like a 5V, 1A switcher with 100-240V input for <$10... time is the ultimate commodity than you can never create more of!

> do hams actually BUILD anything these days?

Sure... look at something like GNU Radio, the Elecraft kits, the TAPR VNA kit, etc.

Being able to build something from a schematic prepares you for a job that pays little better than flipping burgers.

This is very much like mowing your lawn -- if you can afford to pay soomeone else to do it, there's little point in doing it yourself unless you truly enjoy and experience and understand the "opportunity cost" (the time you won't be able to spend doing other things you might enjoy more) involved.

Harry has a small voice/mouse voice. If you're a survivor you may have heard it. It may be technology, projected (from a satellite.) One survivor said she thought she might have an inner alter patterned after Harry. You may have a crown as a receiver (I have a crown of unknown origin, upper left quadrant, near the front.) I heard a Barbra Streisand song in my left ear once. I have a "dimple" behind my ear. Mesh might be part of the conductive system receiving signals from satellites.

Windows is not your friend in this area. Linux, on the other
hand makes this easy. The sound card is a device like
any other. Read from /dev/dsp and you get samples. Write to
/dev/dsp and you make noise.

There is a little bit more setup to buffer things properly,
and you use ioctl() to configure the sample rate, sample
size, and so on, but it's nothing compared to the contortions
Windows programmers go through.

What to do with the samples once you've got them, or
how to generate interesting samples for output is another
matter. Any decent textbook on DSP will help you. I
like Ifeachor & Jervis as a good nuts and bolts introduction.

Yabut - another ham and I were discussing the design of a
phase discriminator. Mention Foster-Seely to any of the
other hams listening and they thought it was a mattress.

One of them didn't know how to solder a resistor to a
PC board ... afaik the others didn't even try. Let me
put it this way - some hams' time would be better spent
opening a book or melting solder than buying a wall wart.

Maybe the economy and so on - isn't what it once was - BUT - those who knock "knowing" electronics would be up a creek - were it not for those of us who DO. Those gadgets don't make themselves.

You're right about the Foster Seeley..... Hell, I've seen "hams" - using the term lightly as we're not all on the same platform - not even know what a "fuse" was!
OR a ground! Eh..... seems to me they should have failed. But - that is my beef with the newer tests. You get all the answers given to you in a book. Years ago, you really didn't know what to expect when you went in front of the FCC. If you didn't know electronics, you were just wasting your time. My - how times have changed.

I hope you're not under the impression that you're doing the Linux
community a service by spreading FUD about how difficult it is to code
for waveOut or DirectSound, or (for that matter) by extolling the
virtues of ioctl(). :-)

There's got to be ten thousand pages of example audio recording and
playback code for both operating systems out there by this point.
Choose your poison and Google for a willing supplier.

I'm not so sure being a "ham" was the point. However, that is how many of the current technicians/engineers (myself included) cut their teeth. IF it weren't for people getting involved in electronics, those who can't seem to understand the desire - would have no computers, no TV, no Stereo, no anything. SOMEONE had to "design" these items and test them for them to be able to be marketed. You just don't do that without "knowledge". Parts can be soldered on by machine if need be - BUT - they had to be designed and tested to get there. These kids wouldn't have their Gameboys, cell phones and so on - if "someone" didn't take the initiative to design and create. Maybe the phones are made in China, so be it - who do you think installs the cell sites? Not chinese. SOMEONE has to know what to do. THERE IS - need for people to become interested in electronics. Give that up and the rest - and yes we will truly become slaves to those who would love to destroy us. It is too easy to sit back and do nothing.

Talking to someone via ham radio means you are talking with someone with
developed skills with which you have something in common. There is a
kinship that is comfortable. Also, it's great fun to use low power and make
contact all over the planet.

There is nothing similar to ham radio, in the internet.

> pays little better than flipping burgers.
>

Not quite. As a kid I learned a whole lot from making other folk's
Heathkit projects work. Sending them in to Heathkit would have been the
ultimate embarrassment for them so they'd rather have someone local do
it. Schematic sez it should work but it ain't, so ... lessee.

That taught me a good dose of diagnostics and showed me lots of ways how
they designed stuff. You learn from examples and then go on to doing it
from scratch.

> This is very much like mowing your lawn -- if you can afford to pay soomeone

Lawn, yeah. Other stuff? Not quite. I am just doing a plumbing/framing
project because a broken fixture in a bath turned out to reveal huge
shortcomings in what the "professionals" did. I am not going to let that
happen again. BTW, they'd esily charge a couple thousand plus material.
Probably doing it myself will in the end equate to a fat three digit
hour rate.

In particular, with ham radio, you don't need an ISP or a telephone line.
You can talk to the other side of the world with no equipment except what is
owned (and could even have been built) by the people on the two ends.

For emergency communication, ham radio is indispensable. Also, I think
shortwave technology should be kept alive in the interest of freedom. A
tyrant can take his country off the Internet but can't block all incoming
radio signals.

Say, doesn't Linux have some provision for using the ham radio bands
for telecommunication? Anyone have any experience with this?

All operating systems do. There's not much to it. What you need is essentially a packet radio modem, and from there, TCP/IP over the air is not hard to do.

You can't mix ham radio with the Internet because of the strict laws against commercial traffic on ham radio. But apart from that, it's a good thing, and very useful in emergencies.

I don't do packet radio myself because it's too much like my day job, but it's certainly a popular part of ham radio.

Old thread, but still worth answering.

* Small signal germanium transistors in glass
packaging, (OC45 comes to memory, TO1 package,)
make good photodetectors after scrapping the
paint.

* Zener diodes are good noise generators
(This is widely known and used.)

* Some small (toy) dc motors wired in series
with a speaker make good siren sounds.

And then, poof, there is a widespread power outage and all your 'modern'
communication is toast. Web, cell phones, everything but radio. Even the
POTS network will become spotty if the outage goes on for too long.
Generators are fine but they won't help when the snow pack is so huge
that a 4WD won't get you there to refuel. AFAIK the record for our area
stand at around 10 days. That makes people realize the true value of
some basic technologies. Now where was that bag of charcoal? Where can
we get some firewood that isn't wet? And where are those batteries?

As Katrina just showed. OUr local newspaper just had a nice spread
about hams being the only means of communication into and out of La. and
Mississippi for a while after the landfall.

Exactly. Almost all ham gear these days runs on 12 volts DC, so anywhere
you have a running car, you can power it. Much of it is low-power and will
run for a very long time on a car battery.

It's nice to know I'm not the only one who connected a neon glow lamp
straight to 120V.

Thankfully I didn't have access to oxy-acetylene until highschool
welding class. I did find however that if you fill a welding glove with
it and then hit it with the torch striker it makes quite an impressive
boom and the glove launches.

ah then you already know, i wasn't smart enough to try container like a
glove, that would have been entertaining

i am glad for alot of descisions at those times but not trying to fill one
of the larger containers ranks high on the list

You get to (legally!) transmit on the HF bands where just a handful of watts can carry a message around the planet... that's still pretty darned cool.

It's also a lot easier to find a free chunk-o-spectrum with a ham license if you just want to build a few transmitters or receivers than trying to do something on the ISM bands... and you get to use a lot more power.

The average ham today probably does have far less "electronics" knowledge than one 50 years ago, although one has to keep in mind that 50 years ago it was a lot easier to have a lot of "deep" knowledge in many fields than it is today. Building something like a modern cell phone requires so much knowledge that you can't really begrudge the guy who implemented, e.g., the Viterbi decoder in some digital logic in some corner of an ASIC the fact that he doesn't know how to solder.

<< Cough! >> Hams certainly did plenty of good work, but there were people with satellite phones in New Orleans throughout the ordeal. Additionally the military had plenty of their own infrastructure, which included satellite links.

For the average person, I think the best thing hams can do in disaster areas these days is to set up a bunch of PCs that ship out short e-mail messages over HF using Winlink or similiar. If the hams can manage to get a reasonably high speed link to a functional hilltop repeater or similar going, setting up a WiFi gateway would be the way to go.

I have a lot of mixed feelings about hams and emergency communications these days. The kind of things that emergency operations personnel expect in the way of communications these days tend to require a fair amount of fancy equipment and a lot of training. Investing that sort of funding into a "volunteer" group is not something that tends to go over very well anymore, unless it's a group such as, e.g., a volunteer fire department where there are strict duties and responsibilities spelled out and not just some "ad hoc" gathering of a bunch of guys at a pizza parlor every month.

I'm convinced that 99% of what the average person does on the Internet would be completely legal if the data packets were going over ham frequencies as well. Reading your personal e-mail? AOK (just don't read your work e-mail!). Ordering a book on Amazon.Com? AOK (just as ordering a pizza through a phone patch is). Etc...

672. LF Dip Meter

Newsgroup: rec.radio.amateur.homebrew

I have several small measuring instruments in my shack, but I have always been unable to find plans to build a DIP METER for use in LF Freqs. I already have a LEADER DM that begins at 1.5 Mhz but I would like to be able to measure resonant circuits at say 40 Khz or 470 Khz. Is there a thecnical difficulty I should be aware of ? Any help or reference appreciated.

Andrew.

Millen used to make a set of LF coils that plugged into one of
their GDOs without any modifications to the unit. It seems then
that you simply need to make an appropriate coil (old wave-wound
IF transformer coils perhaps) and to draw a calibration graph for
it. I was thinking of doing just that but on the other hand,
should anyone have a set of LF coils for sale for the 90652 or any
information on them, I would be most interested.

Cheers - Joe (G3LLV)

Actually, depending on where you are coming from and what you are doing,
Windows can be your friend. Once you have gotten over the initial jolt of
Windows development (admittedly, no small feat), then doing "normal" things
with sound is pretty easy -- probably quite a bit easier than Linux.
However, OP wanted to do some unusal things, and in that sort of case, the
help that Windows gives you definitely gets in the way.

One thing that Windows and Linux development have in common -- everything is
documented and it is virtually impossible to find what you want in the docs.

If you put the tip in a dish of soap solution, you can get bubbles full of
stoichiometric oxyacetylene mix, which make a pretty good _BANG_ when you
light them.

This is better done outdoors than indoors.

How can you be convinced of something that would be illegal? The ham frequencies are for use by people who hold an appropriate license.

Don

Hi..

The operation of the hardware is restricted to those who hold
an appropriate license. Who may or may not elect to share the
usefulness of that equipment with whoever he chooses.

To suggest otherwise would be akin to laying claim that only
those holding drivers licenses could be passengers in a car.

Or that only a properly licensed electrician could make use of
or enjoy electrical equipment. In turn most likely meaning that
you couldn't operate your shack being that you're most likely
not a licensed electrician.

Ken

My favorite Christmas present this last year was a basic electronics kit
like the old RS (or Heath) ones I had as a kid. It was presented to me
by my nine year old daughter...in the hopes that I would build the
projects with her, of course.

We spent an hour putting the kit together, built the first project; and
then I turned her loose...thinking she would build the next most
complicated one, and work her way up.

The next day when I came home, she presented me with a working example
of the most complicated device in the project book. We had a ball
subbing in different components, and then explaining to her why they
made the circuit operate differently.

Lucky you. That possibility isn't remote at all. Happened here about 15
years ago. And this is not a settlement behind the Klondike but we are
35mi from where Arnold holds his office.

That's the only way to get kids interested in electronics. Come to think
of it, I must have been around her age. Maybe a year younger but that
doesn't make much difference. It was a Philips kit that did it.

Later in case her interest persists just be honest with her about the
career prospects inside the US. It ain't that stellar anymore for EEs
unless they are very willing to relocate, even out of the country.

Yeah, it's okay though. I was just pumped that she bought 'me' a toy
which was actually for 'us' to play with. The fact that she took it and
ran with it was a bonus. It shows the aptitude.

At nine, she's got all the choices in the world.

Hi...

Guess I'm easily a generation or few ahead of you, so have a
suggestion, if I may?

Get pictures - lots of 'em - of her working on it, some of you and
her working together, and some of her demonstrating them to her Mom.

Make wonderful, wonderful memories for all of you, and maybe
introduce her to photography at the same time.

Take care.

Ken

Hi...

Anyone who you choose to.

Long distance telephone is now virtually free, and the internet
is free. But I'm in Canada, and my youngest is off to Australia
the end of the month. I may ask you to send a message off in
her general direction, and you may agree to do it. :)

No license necessary :)

Take care.

Ken

Fair point, but I guess the question would be... "the prospects for EEs aren't that stellar compared to... what?" Compared to most people in technical fields I still think we do OK. (I do agree one typically does have to relocate, but at least straight out of college I would hope that most people would _want_ to do that.)

For people who really want to make money, an engineering degree along with a business degree still seems like a really solid combination (in terms of sheer results -- we can save the horror stories of these people for later!).

Hi Joerg,

> And then that fancy equipment won't talk to the fancy equipment of the
> other agency. Happened, a lot.

Yes, and the government continues to pour millions of dollars into radio interoperability to try to make it work. I see no technical reason why getting all the fancy equipment to talk to other agencies should be a problem (look at the Internet -- Usenet news and e-mail seems to make it to all corners of the globe just fine, despite using lots of different brands and types of equipment) -- I guess it really is much more a political problem.

> Keep it simple, that's what hams excel at. And it works.

I agree it helps, but wouldn't you suspect that if you survived all the Hurricane Katrina victims who received help from any formal organization, by quantity those helped by more formalized organizations such as the Red Cross would easily outnumber those who received helps from hams? The problem the hams have is that their help often does go un- or under-acknowledged, whereas everyone knows about the Red Cross.

> They are quite a bit more organized than that.

I guess it depends on the area? Those pictures on hamsexy.com aren't all forged. :-)

I meant that if the people in question had ham radio licenses, of course.
My point was that a lot of people get VERY defensive if you suggest you're
going to provide a straight gateway between the airwaves and the Internet
for licensed hams to use, citing how the fact that there's no realistic
means of precluding that gateway's use for illegal activities (just as there
isn't when one uses an autopatch) should somehow be reason enough to
disallow it in the first place.

Hello Ken,

> is free. ...

Ahem, not quite. I have to shell out $50 every month for DSL. Long distance over regular phone lines is 3c/minute within US/Canada but only with an MCI phone card. Overseas is anywhere north of 10c/minute if you want the 'luxury' of a decent echo cancellation.

But that's not the point. The point is that ham radio is required to be
noncommercial. The Internet is mostly business.

That was my (original) point -- a very large chunk of what most people use their "personal" or "home" Internet connection for is NOT business... just reading e-mail from friends, ordering the occasional book on Amazon, reading newsgroup, surfing random web sites, whatever -- all things that are allowed over ham frequencies. (Which -- as you're probably aware -- are regulated such that you can't engage in activities in which you have a "pecuniary interest," but it's been made clear that things like ordering a pizzaare OK.)

I guess! I moved nine hundred miles from the family upon graduation and another couple of hundred more 20 years later. My father moved from the UP of Michigan to Schenectady NY in the 40s for similar reasons. Comparitively, I have it easy since I've only had to move the family twice (kid only once) and travel is so much easier today. If you want the job you gotta go where it is. If you want to stay home with momma, don't whine about it.

If messages traverse the internet and jump into ham band packets at one or
both ends, and there is an operator controlling the transmission at the jump
points, I don't perceive any legal problems for non-commercial messages.
For "emergency" traffic it would be a valuable process. Maybe some are
doing this..... It's not a brain-buster.

Don

I dunno, I certainly wouldn't want to relocate. I love the area I grew
up in, nearly my entire family lives within a few hundred miles, it'd be
a big hassle to fly in for family events a few times a year. To each
their own I suppose.

Yeah, the whole idea though really turns some people off, unfortunately. My opinion is that reasonably cool heads are prevailing, though, and ham radio regulations are slooooowwwllllly moving in the right direction. It appears that regulation primarily by bandwidth (rather than emission type) will be the law of the land in the next couple of years.

You don't *have* to shell out $50/month. My DSL is $30, but if I wanted
to I could get dialup for $5, or I could go to the local library and use
it for free. The added cost is for the convenience of having a fast
connection at home.

I didn't say people should never come back. :-) I just think one can learn
a lot by moving around a little, trying out different states, countries,
whatever your resources allow you to. My understanding is that in many
western European countries, Oz, NZ, etc. this "experience" is somewhat
formalized, with something like a year right after college reserved for
travelling the globe.

Sheesh, I really need to get back to work and quit getting so sentimental
when stuck in a motel in San Diego for a week...!

I'm sure it will eventually. Ham will either evolve with the times or it
will fade out of existence. I know a few old timers who are into ham
radio but I've not yet met anyone in my 20-something generation who's
into it, not even one.

I love to travel, but by the time I was out on my own I had far too much "junk" to pack up and move every few years and none of the places I've been to seemed all that appealing to live in. I guess it works out well that I live in an area which is quite a hotspot of technical jobs, just glad I bought a house when I did because there's no way I'd be able to now, one would be hard pressed to find a 1 bedroom condo for much under $200K.

705. Astron Power Supply problem

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-19 04:43:07 UTC
From: Kerry Miller <kmiller01at@ticnet.com>
Message-ID: <CNEzf.140599$WH.64582@dukeread01>
Source record: 14206

I've got a problem with my Astron RS-20 power supply. With no load, it's fine, but anything above 4amps or so makes it drop way down and my rig drops out of lock. I haven't measured it under load but the rig works ok to 10 or 11 volts so it must be dropping below that.

I found a schematic and downloaded it, all the voltages are fairly close to what it says on the schematic with no load, I haven't made any measurements with a load on it. I'll pick up a headlight tomorrow to put a load on it and make more measurements.

Does anybody have any ideas?

Thanks,
Kerry, WD5ABC

Astron linear supplies use a 3 terminal regulator, usually an LM317. These things do tend to fail from time to time. Can't tell if that's your problem, but it is likely, and the things are cheap enough it's worth popping a new one in to find out.

Source record: 14211

Sorry, folks, I am not a radio amateur, but this question puzzles me for years, ever since I heared radio programs in an ordinary audio recorder or now, in the speakers of my PC. Admitted, we live close to a lot of short wave staions, but how can this be? is it diodes in my PC that do the job? An electrical engineer friend told me he knows other friends having the same experience, but suggested I ask a radi newsgroup. Here I am.

Can you help me?

Thanks, Siggi

P.S. As a child I experimented with a high-resistance speakers and a copper penny - heated on one side to function as a detector - but then this was a (crude) detector!

Really? What model of Astron linear power supply have you repaired or seen
that uses this design approach? I have never seen one like this -- over
past 20 years.
Confusing this with some other mfg. design?

Astron has been using the 14-pin (30 years old) LM 723 regulator IC with NPN
pass transistors (e.g. 2N3055, 2N3771) ... for as long as I have been
repairing them.

Check here for correct Astron information - repairs, etc.
http://www.kbt-dc-supplies.com/index.php

and Astron schematics (which show the LM723, not the later LM317 design)

No real technical difficulty. Simply use a suitable (large) inductance
and it will probably work.
However, there is a very real practical difficulty. The tuning capacitor
in a Dip meter designed for 1.5Mhz and up, will provide a very small
coverage at LF and the dip may be hard to identify. You will require a
lot of coils to get continuous coverage. This might be OK if you are
working at narrow range of spot frequencies and the circuits under test
are reasonably close to the spot frequency to begin with.

Source record: 14214

Yes, diodes. Usually ones that are part of another structure: the base-emitter junction of a common transistor will act like a diode. There are other nonlinearities inside pretty much any electronics that will detect AM signals, and if the signals are large enough, the result will be audible on connected speakers, etc. The trick is to keep the RF (radio) signals small enough inside the circuits so that it's not a problem. As you noted when you played with your crude detector, lots of things you might not expect can be nonlinear enough to detect AM stations and provide some audio output.

Cheers,
Tom

The ARRL will send you a reprint of Doug Demaw's article for $5. I have a copy of W1FBs Design Notebook and it looks like it has the schematic and the description you are looking for. Sorry but I don't have a scanner. You can often find this book at libraries.

The design uses 40673 dual gate FETS which are an obsolete part. You can find them at surplus houses at about $10 each.

Any particular reason for wanting to build this particular receiver?

Roger

Whether or not a Windows system is reliable has much more to do with the person setting it up than the OS itself; thousands of "mission critical" Windows systems prove that every day. Personally, I'd be choosing my hardware basd on the applications I wanted to run... that pretty much rules out Macs, whereas Linux could be a decent contender given that there is plenty of good amateur radio software for it.

> ALso, there is still too much infrastructure needed to get PCs 'out on the
> web'...With a ham rig, hoist an antenna and your there...

My suggestion was that the best thing hams could do for the average person would be to set up a PC to let them send e-mail, but I'd certainly agree that if you don't have a laptop lying around to do that with, there's still some benefit in being able to relay voice messages. (And compared to a decent HF radio, its power supply, and antenna, adding a laptop as well doesn't do much to increase weight, decrease mobility, etc., but it does provide a marked increase in communications flexibility.)

There are now some fancy HF transceiver out there running Linux or Windows CE... Heck, there are even folks who use their PDAs running WinCE or the Palm OS to interface with their radios!

That is the difference. Agencies are notoriously slow and inefficient in
fixing organizational problems no matter how simple. Someone on TV
suggested to have the welfare program in Califronia run by Jiffy Lube
because they know how to operate efficiently. My guess is that this guy
was right.

>
>>Keep it simple, that's what hams excel at. And it works.

Many people are fine when their good deeds are un-acknowledged. Much of
the ministry and outreach we do through our church is unrecognized and
neither I nor my wife mind. Recognition isn't why we do it.

> ownership of a generator and diesel fuel.
>

Some areas like this aren't geared for a major hard freeze and snow pack. It just doesn't usually happen. Even areas that are prepared can get hit hard. In Europe they had a major issue this winter with ice build-up on HV lines. It happened in unprecedented magnitude and then many of the lines came down.

Andrew-

Do you have an audio oscillator that goes up to 470 KHz? That could be
hooked up to a resonant circuit through a resistor, and a high impedance
AC voltmeter connected to measure voltage across the circuit. You would
look for dips or peaks depending on whether it was series or parallel.

Even before the Internet allowed commercial traffic, ham radio had to be
careful of people whose f*cking language was f*cking against the rules,
if ya know what I mean.

Interesting. I make a system that allows contact with spirits/entities and don't get sounds of hell, even though some of the contacts can be somewhat negative sounding, and threatening. I have a site to share information
http://franksumption.tripod.com/

There does seem to be faction out there in the nether world that would try to scare off would be researchers, and can sound demonic, and threatening, but it's been my expereince that it's only a paper tiger. I've been doing this work for six years now, and have always found it intriguing, and fasinating, but never harmful.

I'd think coupling to the DUT would be a problem. Physically small dip
coils would not couple easily to large tuned components, and versy vicey.
Of course, if you build to just _your_ custom requirements....

>
>Someone could tell it to me

If you're referring to his "HIGH POWER FM MIC" project, the page says the following:

There used to be a 1n0 5mm cap for supply decoupling, but after a cange of component supplier (manufacturer?) there developed some form of RF instability when the gain of the PA transistor was a little above normal. Replacing the 1n0 to an electrolytic capacitor of 22uf cured this problem totally. Any "radial" (the leads both come out of the same end) type electrolytic capacitor from 0.47uf upwards cures the problem.

So, any small electrolytic cap of .47 uF or above, 12 WVDC or above, ought to do the trick.

Ugh, white eyes start to see truth. It has been made too hard to do kit
electronics that is worth having, everyone expects to be able to build
something fun and useful on the first try; no thinking or much effort. I
have seen too many of them when the decide on engineering when they are
sophomore in college; and have no clue as how to understand or apply the
underlying theory. What bothers me the most is that somehow they graduate.

This lament is often repeated in many of the hobbies which are now
considered the territory of the oldsters. Communicating by radio and
messing with thumb-sized electronic components is passi¿½. So is
collecting rocks or fern samples and scale model railroading.
I'm not so quick to write off a whole generation because they find their
stuff cooler than mine. That kid hanging at the mall can reach into his
pocket and pull out his toy and be in contact with China in a matter of
seconds. That pretty much kills any hope of impressing him with my rig
and hobby for communicating. Whoopee, I can build mine - but it doesn't
"work" as well as his.

There have always been kids who get into all sorts of things. I don't
think that the percentage of kids interested in technology has
decreased...I'd be inclined to think the opposite. Technology has
changed much more than the kids have. How many old radio farts are into
THEIR modern technology?

I can confirm that mine has a 723, not a 317. Thanks for the web sites,
looks like some great information. I hooked up that headlight tonight
but it ran fine, pulling a bit over 3 amps for an hour or so. Maybe I
need more load to make it lose regulation.

Guess I'll start digging into that regulator board, the transistors and
all the big things like the transformer seem to be fine.

Thanks,
Kerry - WD5ABC

Why aren't they going to engineering school? There's no doubt it takes considerable effort. Take a look at the breakdown at the U.S. engineering schools and you'll find a small and decreasing number of Americans enrolled -- at least those who got their primary and secondary education here. Some major U.S. universities are even building branches overseas in order to scare up enough students. And it's unusual now to see a paper in the IEEE Transactions on Antennas and Propagation written by someone raised in this country. It appears that our educational system and the general culture is preparing people to be Wal-Mart clerks, not engineers. Technologically motivated Wal-Mart clerks, perhaps, but Wal-Mart clerks nonetheless. ("Joe over there is a real whiz on the customer computer terminal. I'll recommend him for a 25 cent raise if he keeps it up.") Engineering will soon join manufacturing in overwhelmingly being done somewhere else, and for good reason.

Roy Lewallen, W7EL

There were plenty of Americans at Georgia Tech the last time I looked... all over the place, in fact! And even MIT...

The reason IEEE Transactions papers seem always to be written by foreigners is something to do with incentives, I think. Americans do engineering but don't publish papers about it, at least not in IEEE Transactions. I think this has something to do with the way American vs. Asian employers operate.

> by someone raised in this country. It appears that our educational system

And in 1955 it was preparing every male to be a football player and every female to be a homemaker. Yet we survived.

Another thing to keep in mind: Circuit design is yesterday's challenge. One of the biggest technological challenges we face is how to organize and manage huge amounts of information. I know a lot of young people (2 of them in my own house) who are keenly interested in that. It just isn't something that looms large in the "engineering" curriculum yet, just as electronics didn't in 1880.

Sooner or later, one would hope that that kid in the mall would like to see beyond the "magic" and have a sit-down chat with the man behind the curtain. The Internet, cell phones, etc. ARE very cool, but if one can start to understand the technology behind them, hopefully they'll also understand why something like HF radio, simple AM/FM receivers, etc. can be cool as well.

There was an article in some IEEE magazine not too long ago where the author was lamenting the fact that not only are things like digital radio and video very complicated to understand in the first place, but in nearly all cases today the details of their formatting/modulation/etc. are purposely obfuscated and the content itself encrypted, so pretty soon it's going to be pretty much impossible for a motivated youngster to build a contemporary radio receiver even if he or she did have access to the appropriate hardware. A good example would be something like IBOC -- something like GNU Radio is inexpensive (i.e., something a youngster could reasonably obtain access to), yet there's no way to demodulate it since the standard behind it is proprietary. :-(This despite the fact that it's being broadcast on the "public" FM frequencies...

I think we can blame that one on the public education system moreso than any lack of interest. Public schools have exchanged emphasis on technical skills (like spelling) in exchange for 'feel-good' subjects.

In years gone by an average kid who studied hard and got good grades could get into an institution of higher learning. Probably had 2-3 years of advanced math under his belt and could find the college on a map. Nowadays a straight A kid may only have his straight As in non-engineering subjects and has little chance of getting into an engineering school unless he has been privately educated or was exceptional enough in a *good* public system.

First, test each NPN transistor with a VOM or DVM ... both methods of proper measurement are outlined (added proper method for DVM testing to procedures)

Second, discharge electrolytic capacitors before removing or inserting the LM 723
Most Astron regulator boards have a socket for the LM 723, IF not after removing, install socket - observing proper placement of pin 1.

Check bridge rectifier and diodes in circuit.

The KBT site suggests substitution of a resistor value. There are also suggestions for bypass capacitors.

Stray RF in your radio shack can cause problems in some supplies.

Computing skills can be learnt without the need for schooling, due to the internet and its wide freely availabe range of self teaching materials. Also this education can happen at times convenient to the learner. It is a real move forward from the traditional schooling model. Now we have large numbers of capable but not traditionally qualified people, who didnt attend engineering school.

> There's no doubt it takes
> considerable effort. Take a look at the breakdown at the U.S.

Maybe we're seeing the same effcet as happened here (Britain) in the ealy 1900s. In victorian times, building was a great technology, but as new areas of tech came along, less and less people were involved in building, and the standards of quality in that trade declined. Same today with electronics, now that computing has become a serious and powerful force.

> Roy Lewallen, W7EL

It strikes me as a simple case of consequences of actions. US public education is of low quality, so people arent coming out well educated, motivated, or able to make good of their lives. When a country's education is as good as it can be, instead of as bad as it can be, not surprisingly people come out more capable, more motivated and so on, and go on and do well.

This is a basic error in American politics. Spend as little as possible so I get to keep my share, but its then a greater share of less in total. The only way a country will do better and better over time is if education is as good a quality as one can get.

When you produce so many badly educated people, there becomes no longer the ability for the masses to understand the issues well enough to make the right policy choices, and things decline even further. Through history, those societies that have done relatively well have been ones where education was regarded as real important. It is a simple choice for US to make, but US seems to show no insight into its condition.

Here in Britain we're going the same way, with standards falling all round, sacrificed in many cases to rather naive pc ideals. I just hope, as the evidence mounts up, that PC will be put back into its proper place some day.

Yes, in the 50s we did do all that, but there was still time for ham radio
(midnight to 3am when HF was open to the world).

>
> I think that, thanks to computers, the proportion of technologically

My opinion is a little different. In the 50s we were motivated to study
electronics and use the technology to build equipment and then to use the
equipment, modify it, and recover parts from it to try something different.

Most of today's youth doesn't care for all that work. Getting "it" and
using "it" is the entire objective.

Using the products of technology is a spectator sport.

Roy,

I believe that the shrinking engineering school attendance is directly related to the shrinking engineering job opportunities in the US. Global communications have enabled large US corporations to move a significant portion of their high paying technical jobs off shore to lower cost regions. With fewer and fewer opportunities, the out of work engineers, find themselves competing for fewer and fewer jobs. HS students selecting a college major see this and many of them decide that it is more important to be able to make a living than to pursue this discipline. Many of my former peers elected to change careers with a significant reduction in salary when they were unable to find engineering work during the last few years.

Bob

Nah, the idjits are going into idjit jobs, just like they always did.
More of the smarter kids are going into medicine, law, and business.
It takes more effort and money than engineering, perhaps, but the
payoff is you are less likely to be outsourced or become obsolescent
halfway through your working life.

Because of the Not-Ham action of maliciously getting
someone's licence cancelled, it is meet to remind us
what is (AND WHAT IS NOT AND NEVER CAN BE)
Ham Radio, and to this end, I append a FAQ.....

Orator For Decency wrote:
> I have just had my renewal cheque returned to me with the comment

What is Ham Radio?

(Preface)
It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery. Even
the Usenet newsgroups dedicated to the cause have degenerated
into a hotbed of abusive onslaughts by those who ought to know better.
However, there still exists the fundamental basis on which Ham
Radio is based, and that will never die. This FAQ ("What Is
Ham Radio?") will be regularly published and will not be
shouted or bullied down. It is important that those of a
technical bent, who are the natural seed-corn of Radio Hammery
and who gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_
to you to exert yourselves to join our fraternity! (If you find
otherwise, then perhaps you are already classing yourself in the
mediocre groups of those who are criticised in the FAQ and from
whom we _MUST_ dissociate? If so - it's never too late for
a re-taxonomisation on your part - there's nothing elitist about
us, and we welcome all those who are prepared to put themselves
out in order to join our ranks!)

-----ooooo-----
(Article)
So,.....What is Ham Radio?

Ham Radio is a technical pursuit for those who
are interested in the science of radio wave
propagation and who are also interested in the
way that their radios function. It has a long-standing
tradition of providing a source of engineers who
are born naturals.

Ham Radio awakens in its aficionados a whole-life
fascination with all things technical and gives
an all-abiding curiosity to improve one's scientific
knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience
with ones fellow man, and shows itself in the
gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that
they can construct and operate their own equipment! No-one
else has this privilege. Users, such as broadcasters,
the po lice and armed farces, CBers and mobile phone
users have to purchase ready-made gear. Manufacturers
are not licensed to operate their gear. Radio Hams
are qualified to design, build and then
operate their own pieces of equipment. They do this
with gusto, and also repair and modify their own
equipment. This is a privilege well worth the effort
to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with
relatively simple technologies at first, perhaps making
his own Wimshurst machine and primary cells. Small pieces
of test equipment follow, possibly multimeters and signal
generators. Then comes receivers and transmitters. It is with
the latter that communication with like-minded technically
motivated people takes off. The scope for technical
development grows with the years
and now encompasses DSP and DDS. There is also a great deal
of excitement in the areas of computer programming to
be learnt and applied.

The technical excitement motivates Radio Hams to compete
with each other to determine who has designed and manufactured
the best-quality station. This competitiveness is found in DXing,
competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a
desirable thing to have that there are large
numbers of people who wish to be thought of
as Radio Hams when, in fact, they are nothing
of the kind! Usually such people are a
variation of the CB Radio hobbyist; they buy their
radios off the shelf and send them back to be
repaired; they are not interested in technical discussion
and sneer at those who are; they have no idea how
their radios work inside and have no wish to find out;
they are free with rather silly personal insults;
they have not satisfied any technical qualification
and their licences prevent the use of
self-designed-and-built equipment.

These CB types engage in the competitive activities
with their Cheque-Book-purchased off-the-shelf radios
in a forlorn effort to prove that they are Radio Hams.

No _REAL_ Radio Hams are deceived by such people!

-----ooooo-----

One such CB type is the so-called "Not-Ham". Otherwise
known as the CBer-Masquerading-As-A-Radio-Ham, this type
had their background in the hobby that is CB Radio and not
in the technical pursuits that lead up to a coveted Ham licence.
Easily recognised by their boasts of the criminal activity of
11 metre SSB operation, one wonders why they don't go back to
the CB Bands if such bands are dearer in their hearts than are the Ham
Bands? No _REAL Radio Hams associate with those who made an
illegal installation of transmitting equipment before being
in possession of an appropriate licence.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist
from the _REAL_ Radio Ham is to solicit their view of the
difference between CB Radio and Ham Radio. A Radio Ham will
perceive Ham Radio to be a technical pursuit and will
perceive CB Radio to be a social communications facility
no different in essence to a land-line telephone or a
GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
could also hold a CB licence safe in the knowledge that
such a licence says no more about him than having a land-line
telephone, whilst continuing to regard Ham Radio as a separate
technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between a Ham Radio licence and a CB Radio licence. To him, they are sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then tries to classify himself as the equal of the Radio Ham when, in fact, he is nothing of the kind. A sure sign of a CB Radio hobbyist is if he holds, or has ever held, a licence issued under the gangrenous degeneration that is the M3/CB Fools' Licence scheme.

-----ooooo-----

One group of people who claim to be of the standard of Radio Hams but who are in reality nothing more than an apology for the failure of a CBer are those class B licensees who falsely proclaimed that they were against the use of a Morse Test to control access to the HF bands, until, that is, a test was introduced at their intellectual level, the intellectual level of 6-year-olds.

6 year-olds simply lack the mathematical tool kit to enable them to handle even the simplest algebraic manipulation for Ohm's Law and thus, the disgraceful Class Ber's in the aforementioned category are not Radio Hams by any stretch of the imagination!

Remember - A sure sign of a CB Radio hobbyist is if he holds, or has ever held, a licence issued under the gangrenous degeneration that is the M3/CB Fools' Licence scheme!

Once you get past a certain point, any further doesn't mean much.

> Home can be almost anywhere as long as one is willing to make friends,
> integrate and most of all, learn the customs and the language.

Sure. Family is still important. I'd like to be closer now that
my mother is getting older (92) and won't be around forever. We
missed being close to my MIL (died a year ago) and the FIL (20
years ago). Seeing family once or twice a year is a negative.
Living next door is on the other extreme, however.

hmm, better check to see if your setup is working. If you are listening
to the bands where propagation is working it is getting difficult to
find an open space.

I want to take high res mountain and city pictures with homebrew radar.
Some use passive radars and produce synthetic aperture radar images.
Passive radars use gsm , vhf , uhf , sw , fm , satellite transmitters .
But I am not sure about the quality of resulting image.
- Some italian researchers did it but I saw the images and I did not
like.-
If it will not not satisfy my need , I will want to build a transmitter
and receiver.
Do I need to use a gunnplexer ? Or is there any new transmitters at
market ?
What is your idea for building a sar ?

I would look at the radio first. Put an ameter in the 12 volt line to
the radio and see how much current it is actually drawing.

American youth are being steered in other directions now. And even
those who are not being steered in that direction may take a look at
engineering and wonder "Why the heck would I want to do that"?

The kid is going to have to work long and hard though their college
days. No gut courses for you, my friend! Then they are going to get a
job in which they are expected to get their job done, and if that means
you work 80 hour weeks, then so be it. That nice paycheck isn't so great
when you break it into hourly rates.

There is a lot more money to be made, at less effort, by becoming a
manager, MBA, or the like. So unless a person really really has a
passion for engineering, they select some other way to make a living.
And for good or bad, too many people chase max money at minimum effort

Well, it still matters whether it takes a multi-leg flight of 20+ hours
to get there or a one-hop of 7 hours. But I won't complain when I think
about folks who emigrated from Europe to Australia. Getting to their old
home country is a major endeavor for them.

When my wife's parent's were still alive it was nice to know that we
could be there in half a day, which we had to do a lot.

Yeah, I want to get my spam via Ham radio!!!

Considering that some 73 percent of email is spam and/or virus laden garbage, and that there are much better ways for Hams to get their email if they really want to, utilizing HF for email solutions is like an answer to ten year old questions.

Besides - thinking that email is "High-Tech" is to start off with an erroneous assumption.

> I know a few old timers who are into ham

A sample of one? I know several young amateurs in my area, and we turn out dozens every year at the local college. And some other stats are that plenty of new licenses are being issued. I can't vouch for the ages of these newbies, but even if they are not kids, they are new hams.

Your correct about the Apps. That is why I end up using both PC and Mac
on a continual basis. The Mac has it all over the PC in terms of getting
the work done, Especially if I have to make any software or hardware
changes.

I dunno, Joel. Are you saying that using a Ham radio to send email is
going to impress someone? It just seems so odd to me that people who can

now text message others with their cell phones, and IM each other on a regular basis are going to be impressed by a big HF setup. I mean email in general is a real yawner (unless we buy those stimulants offered in the 75 percent of email that is spam) 8^)

My dad and stepmom live next door. It makes it a lot easier for me
to check on them that way. I don't drive much anymore, so I wouldn't
see them very often if they were across town.

My brother and SIL got delegated that task, though they live 50mi
away. We spent Christmas week visiting mom and my brother spent it
in Costa Rica with the SIL's family (Brits).

761. Fair market value of salvaged parts.

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-20 20:07:54 UTC
From: The Eternal Squire <eternalsquire@hotmail.com>
Message-ID: <1137787674.639411.263920@z14g2000cwz.googlegroups.com>
Source record: 14112

Hi,

For tax purposes I need to know how I can determine the fair market
value of a resistor,
capacitor, inductor, or active component in working condition that is
salvaged from
scrapped equipment.

One way, I suppose, would be to ask how much a disinterested party like
yourself(s)
would be willing to pay. Another, I suppose, would be to treat each
part as a piece of
clothing and assign it 1/2 to 1/4 retail value as a used article.

Opinions?

Thanks,

The Eternal Squire

Value of scrapped equipment: $1.

Labor to strip components: $200.

Value of stripped components: Negative $199.

Is this for "income" determination or for "inventory tax" purposes?
Inventory tax has to be the most anti-scrapyard thing ever imagined.

Tim.

Not to drag it off topic, but I'm confused about what looks like ground shadows in Sandia's SAR images. For example, the tower shadow in http://www.sandia.gov/radar/movies/solar.mov continually points toward the "viewer". Is this reflected radiation from the tower off the ground?? Really weird false lighting effect if that's what it is. Also, ground shadows under trees in other images make them look like false color satellite photos.

I think if you're going to do it, large synthetic apertures would be most interesting. :)

Mike.

In Europe that was easier. You could do it in a little over half that time for the 900 miles. The best we did for the 400 miles to the inlaws was 4 hours and 8 minutes. Last time it took longer per mile but that was because my father's car won't go above 110mph.

Doesn't necessarily mean they signed off. We live way too far from any
relatives. So, we picked some 'instant relatives' in nursing homes and
so on. There are plenty of people there who are never visited by anyone
else.

If you think of it, man is illuminating the earth with RF "photons"
continually. It should be possible to image all types of structures in
3D with the proper receivers.

"I believe that the shrinking engineering school attendance is directly

related to the shrinking engineering job opportunities in the US.
Global
communications have enabled large US corporations to move a significant

portion of their high paying technical jobs off shore to lower cost
regions.
With fewer and fewer opportunities, the out of work engineers, find
themselves competing for fewer and fewer jobs. HS students selecting a

college major see this and many of them decide that it is more
important to
be able to make a living than to pursue this discipline. Many of my
former
peers elected to change careers with a significant reduction in salary
when
they were unable to find engineering work during the last few years. "

Roy is right...kids are not entering tech fields because the writing is
on the wall.

If you haven't noticed, millions of tech jobs have been offshored in
the last few years with the blessing of the government...and in a time
of war no less. Time after time I have heard a parent say that no kid
of his is going to be an engineer, computer programmer or scientist to
have his livelihood taken away when he/she reaches 40. In my own
opinion, until this country gets its priorities straightened out and
reward those who truly contribute to the bottom line we will not see a
change. Kids are smart and they follow the money...and science and
engineering is not where it is at. Also if there was a REAL shortage of
technical people you would see the wages for that speciality
rise...instead we just see more green cards issued. What companies want
is good cheap labor and their complaints are because as offshoring
continues the low cost wage employees are being more scarce overseas
which causes their labor costs to go up.

Read this article to see what society really wants...

http://news.yahoo.com/s/usatoday/20060119/bs_usatoday/newmbasfindingeducationpaysoffbigtim
e&printer=1;_ylt=AgfwM1DRQusR3Kr5kayD0aXrB2YD;_ylu=X3oDMTA3MXN1bHE0BHNlYwN0bWE-

"The $106,000 salary and signing bonus was up 13.5% from 2004,
according to a GMAC survey of 5,829 2005 grads. Salary alone increased
to $88,600, surpassing the previous high of $85,400 set in 2001."

Money talks.

Sounds like to me the "Fold-back Regulator circuit" just cut-in, during
operation, if a adjusted threshold value is exceeded, instead of popping
a fuse, the circuit just drops to a low value until the circuit is
re-set by powering-Down and re-started !

This is to determine initial corporate inventory. The fair market value of an item is defined as the price a disinterested party is willing to pay for it in an arm's length transaction. So that value of stripped components actually isn't negative, this is why salvage works: it creates value by selling saleable parts from a valueless scrapped object.

Actually, I first thought it was an antenna problem, the rig acted just like I had a bad problem with RF in the shack. I spent all of one afternoon reworking the grounds and tuning the antenna. I've got the best-tuned 4BTV in Texas! I tried it on a dummy load and had the same problem. So, I pulled it off the power supply and ran the rig (Yaesu FT-990) from the battery in my truck and it works fine. I also tried the supply on a second rig, a TS-430, with exactly the same problem - when I transmit the lights on the rig dim and it drops out of lock. The 430 is my mobile rig, it works fine in the truck but not on the PS.

I'll follow you guys' suggestions to start testing parts. I'm in a fairly small town, so while I bought a 1000uf capacitor today at Radio Shack, they can't even order an LM723 so I'll have to find someplace else to get one.

Have any of you guys tried the new switching power supplies? I've seen the one at Radio Shack (claims 25a but I doubt it), MFJ and Astron but haven't ever used one. I normally just run 1 HF rig (max 100w) and a small VHF rig (max 25w) for packet. Is a switcher solid and reliable enough for something like that? I've considered getting something like that and rebuilding the Astron when I can get the parts.

I have built regulated supplies but it's been 20 yrs since I tinkered with anything analog, so I'll take all the help I can get! The info at those links looks helpful, along with the ideas you guys have given me here.

I'm looking to clear out some clean, working equipment at the end of a couple of long-term personal projects. This shortened URL will take you to eBay's "View Seller's Items" page for my account:

http://snipurl.com/ls89

Highlights include the nicest HP 8566B spectrum analyzer out of several that I've owned; an HP 8662A with OEM manuals and brand-new PS filter caps; and an HP 5345A counter with enough spares and accessories to satisfy any ECL computing buff.

Most of these items include manuals, and all of them will be sold with 3-day buyer inspection periods. Local pickup in Seattle OK. Even if you're not in the market, several of the listings include some interesting HP Journal .PDFs and other literature. Check 'em out!

I don't get it. Seems like a disinterested party and a buyer are two
different things?

But I'm clearly not a lawyer either.

~~~~~~

You might be able to find a good deal on an Icom PS-125 switching power supply. Icom had a promotion where they gave one away with each purchase of an IC-746PRO. A lot of guys bought the '746 but didn't need the power supply and I've seen many for sale as a result. I have one and it's a great supply. I'm keeping mine :-) Check rec.radio.swap and eBay.

a disinterested party has no interest in the item and therefore the
item has no value.
Don't we love English in a legal document, it can be made to say
anything, everything and nothing in the same sentance.

How true, and I'm glad to hear that others have the same attitude towards the elderly. A request was made yesterday on our WOCA "Veteran's News" program for people to take the time to visit veterans in a couple nursing homes. Most of them have little or no family left, or no family close by. I used to visit some old veterans when I lived in Ohio. They were neighbors who had plenty of relatives who couldn't be bothered to visit, till they died. Then they were there, badgering the widows for all of his possessions. These days I have a lot of trouble getting around, and my time is tied up with the computer project, and a website of Veterans news and information. BTW, there is a new VA website for prescriptions. Anyone reading this who is a US veteran and in the VA medical system can refill their prescriptions at https://www.myhealth.va.gov/ and not hassle with the mail-in forms or wait while on hold on on the telephone. I've used it, and it works.

Part of my "Computers for Veterans" project is to place at least one working computer in any nursing home or long term care facility near Ocala that has any Veterans in residence. I know that not all of them will be able to, or even want to use a computer for E-mail and browsing the web, but I want to make sure the ones that can and do, will be able to.

You must have built a different GNU radio than i have seen. When i priced
building it, the result was between $1000 and $2000. I have other things
that i want to do with that much money first.
Just the same, i expect that if someone could come up with an affordable
[$100 - $200] software defined radio, with really good tools to experiment
with, that it would change the world.

> This is to determine initial corporate inventory.

My advice here is to choose the method that gives you an answer of zero. Otherwise you have to deal with inventory taxes (depending on locality).

> The fair market
> value of an item is defined as the price a disinterested party is
> willing to pay for it in an arm's length transaction. So that value

> works: it creates value by selling saleable parts from a valueless
> scrapped object.

If necessary, do not create taxable value until you can sell it. "Creating value" that you have to pay inventory taxes on is foolish.

The folks that actually do this stuff for a living (usually meager, but they seem to enjoy it) quickly learn that if you aren't turning over your inventory several times a year, that you aren't making any money.

Realistically the IRS may very well classify your attempted business activities as a hobby if all your components sit in boxes for years without getting sold. And classifying it yourself as a hobby may be a good thing too, at least psychologically.

Some localities also tax personal (non-business-inventory) property and I also advise you to not inflate this number either!

Important note: I am not in any way a business or tax advisor. But I do know (through the school of hard knocks) what I have to do to keep my hobbies/obsessions from becoming some stupid time-and-money-sink business model :-). That doesn't mean I don't do them, it just means that I keep them in a separate compartment in my head full of holes.

Tim.

Aye, the first great American engineering layoff was in the early 1970's and
the second in the early 1990's. In both cases over 10% left engineering
permanently. When the kids ask around they hear about this, small wonder
it has become unpopular. Also publishing papers is done by academics,
engineering is done by engineers.

Personally (for ham radio purposes) I wouldn't normally buy individual used small components that have a current retail value of under about $3. I would rather get new ones which have a greater probability of working (regardless, in my opinion, of the seller's claims regarding testing) and, in some cases, longer leads. By this thinking around 95% of parts found in typical equipment are of no value, which simplifies your calculations.

For more expensive components, something like 10-20% of the new price is about the average of what I would pay.

Normally unavailable replacement parts and "antique" parts are another story, of course.

I've built a few dip meters, most with the circuit using a dual
gang variable cap. The Millen dip meter is the same circuit.
The variable caps are usually around 100 to 200pf per section
giving a total tuning range of 50 to 100pf across the coil.

This works well up to about 1mhz tops, below that feedback
drops off as the reactance of the variable cap is too low.
IF the tuned circuit is ac coupled to the tube (plate blocking
cap in place) you can ground the center of the coil to provide
additional feedback. The Millen coils DO have a third pin
for this purpose. (My dipmeters used the 'Heath' method of
an RCA plug for the coil connecter so they lacked the means
of providing the ground).

My coils were wound on 3/8" dia plastic tubing (like Heath)
and I could get down to about 2mhz with a single layer coil
wound with #36 wire. To get down to where you want to go
will require a larger diameter coil form, and a "Pi" winding
(like on rf chokes). Litz wire would also be a good idea.
The tuning range even with a 200pf / section variable cap
will be less than a 2/1 frequency range due to distributed
capacitance across the coil. Coupling should not be a problem,
if you can get the dip coil close enough to the inductor in the
circuit under question. This is where a small dip coil has an
advantage....Try getting those Millen coils close enough to
a modern solid state circuit!

Surf my web site (www.qsl.net/wa2mze) to see my mini gdo built

Hello again ,

May be you are right . A passive radar can do the job. I saw at
internet , some italian researchers use tv satellite source and single
lnb receiver and they create an radar image of buildings with this
passive radar. Their results are terrible and neither look like 2 d
cheapest camera image nor a most basic radar image.

And I want a few centimeters res dem image.
I think I must satellite transmitters as source.
Where can I learn the satellite routes and their frequencies ?
What kind of receiver and antenna success ?
I found ku band satellite receivers with lnb for 120 usd. Do they work
for me ?
They are the highest frequecy receivers I could find cheap.
Are there higher frequency cheap receivers or schematics at internet.
I could not find.
And they must be compatible with satellites.
Do gunnplexer receivers work ? They are really cheap .
Awaiting your ideas .

Best ,

Mustafa Umut Sarac

In article <dqt5su01t19@drn.newsguy.com>, Winfield_member@newsguy.com
says...
> Shit, John, you're selling your stuff!??!! What's going on?

Short answer: I treat eBay like a giant storage locker, where they pay
to keep my stuff while I'm not using it. :-)

Long answer: my usual M.O. is to undertake long-term personal projects
in batches of two or three, which often take years at a time. I've
recently reached a point in one of those cycles where I'm happy with the
results and content to call it all "done" for the time being.

My next big thing is purely software-based, in an entirely-unrelated
field. I've already put a lot of work into this project, and it's
become apparent that I'm going to have to focus on it to the exclusion
of pretty much everything else if I'm ever going to finish it. Because
I've got at least another year of software work ahead, it doesn't make
sense for me to pay to store a lot of hardware that someone else could
be using towards productive/fun ends.

I'm not the least bit happy about giving up some of that gear,
particularly the 8566B. But if I keep it around, I will play with it.
Historically, that's been a fairly-serious (almost addiction-level)
personal problem. It gets in the way of other long-term goals, so I
have to take positive, hard-to-undo steps to move ahead.

Watch Gandalf trying to convince Bilbo to give up his favorite toy, and
you'll get the idea...

I'm tempted on that TEK 485. I have a working (but UGLY) 454 scope
and the 485 is sortof it's smarter brother. The shipping charges from
your neck of the woods is a killer though (long distance cross country
to FL). I'm not sure if my 454 has the p11 phospher or P2 or P31, would
the option be stamped on the nameplate?

Hi Kerry, Since you have the voltage, and I assume that you checked it at around 13.8 volts, and are not getting the current, there are usually just a few simple things that usually crap out on these power supplies. Please note, I have 3 or 4 RS-35s, (not an RS-20) but they are built alike, enough so, that you should be able to figure out the problem. First, providing the pass transisitors are good, and with the power off, and AC unplugged, and filter caps discharged, look on the backside of the supply, and you will see 4 sets of double paralelled 5 Watt .05 white, square inch long power resistors connected between the 4 pass transistors and BUS. Using a ohmmeter, check these for around .025 Ohms resistance. If its a taste higher, OK... However, once you get to around an Ohm or more, your power supply will exibit the conditions you have mentioned. These resistors provide emitter pass transistor protection as I recall, and many times will fry, and you will not know it unless you measure them. If I find these resistors have gone south, I further test the supply by jumping the resistors with test jumpers. You'll know right away if the problem went away by using a test rig to draw some current. PLEASE NOTE, I have fixed quite a few Astron supplies, BUT if you blow your supply up (or test radio) even more than it is, don't blame me for any info I have provided. If it works, change out the resistors. I don't recommend you just jump them out..Oh, BTW, since you have the LM723 regulator, look on the bottom side of the board, and see if there is a resistor, hanging in mid air, which has a wire connected to it that runs down to the bottom floor of the supply, and is attached to a 3 prong transistor in a T0-220 case. Sometimes, this resistor will fry, causing current problems too.. One of my early supplies has the LM317 regulator, but,

you won't have to worry about this, as this requlator is not there, however, the mounting holes (open of course) are still there on the mainboard in the upper left corner.. Hopefully, this will help.. Best Luck OM.. Tony, WB8MLA

I believe that all the 454s had P31 phosphors, going by personal
observation and Sphere Research's CRT listings. That's what's in my
'backup' 454 (which isn't for sale).

To some extent it's like trying to prove that no crows are white,
though. Tek made some oddball scopes in small quantities over the
years, so you can't be too sure what's out there.

796. Question about Tektronix SC501 scope

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-22 00:19:59 UTC
From: hexter@blazenet.net
Message-ID: <Q62dnVEOYNkyUk_eRVn-tw@suscom.com>
Source record: 14146

Hi folks,

I recently bought a used Tek SC 501 scope to plug into my TM500 series rack. It is only a 5mhz unit and I bought it more for audio and afsk type projects. The highest unmagnified writing speed is 1us/div and with the X5 mag it's 200ns/div.

The crt beam seems very feeble at these two highest writing speeds. Very unimpressive for what I would call Tek's normal high standards. Not in the same ballpark as my SC502 dual trace unit for instance.

This unit is used and came from a GE lab environment. It perhaps has thousands of hours on it, I'm not sure.

Were these SC 501 scopes just a dog or is my crt shot??

I notice the literature lists a very lame 1KV as the acceleration voltage. That is pretty low for the job at hand isn't it?

Thanks to all who reply.

Is it just simply RF getting back into your supply and causing
havoc? Perhaps the supply is O.K.? You need at least 3 headlights
to get the supply under a load that compares to your rig. Try
more lights and see if it craps out.

~~~~~~

Are you triggering the sweep at the higher speeds or just letting it
auto-trigger? Auto-trigger is done at a low rate and makes the sweep
very dim until it gets an actual high frequency trigger.

Bill, W6WRT

For people who actually get significant portions of spam, I agree with
you -- I'm a little leery of them getting their e-mail via HF! On the other
hand, I think that most people who make a minimal effort can deal with
having multiple e-mail accounts, and being very careful to keep the
"important" ones off of spam lists. (I have a couple that have never
received spam, because probably no more than a dozen people know of them!)

Hi Mike,

"Mike Coslo" <mjc5remove@psu.edu> wrote in message
news:43D13915.4020009@psu.edu...
> I dunno, Joel. Are you saying that using a Ham radio to send email is
> going to impress someone?

I'm saying that putting up a big sign saying, "Send e-mail here!" and sitting people down in front of a computer (say... a mini Mac :-) running Outlook or some similar easy-to-use mail client that pretty much anyone (who's active on the Internet at all) can figure out how to use is a considerably bigger help than putting up a sign saying, "Voice communications relayed here!" and having a licensed ham sit there, take someone's message, relay it to another ham outside the affected area, they make a phone call to a family member (or whatever). The former just seems a lot more efficient to me.

> It just seems so odd to me that people who can now text message others
> with their cell phones, and IM each other on a regular basis are going to
> be impressed by a big HF setup.

Sure, if those people are actually in a city, interstate corridor, etc., where there's cell phone service. If not -- as folks into sailing the ocean quickly find out -- suddenly having at least some low bandwidth e-mail connection is a lot better than nothing.

I've posted before that my "grand vision" for amateur radio runs along the lines of people within cities or major corridors using WiFi, EVDO/EDGE, WiMax, etc. -- multi-megabit per second connections, that use ISM bands so actually don't require hams at all to set them up, those who are camping/hiking/traveling outside of such places using a presently non-existant network of hilltop repeaters that operate at some many tens to low hundreds of kilbits per second (128kbps is a favorite of mine) with, e.g., 5W handheld radios, and those truly out in the "the middle of nowhere" (the ocean, the outback, etc.) use HF at a couple kilobits per second. Developing that "middle" ground of speed vs. coverage would do a lot to relieve pressure on HF where of course there is so little specturm to begin with; I have a suspicion that an awful lot of, e.g., WinLink traffic comes from people who are still easily within range of being able to hit at least a couple of hilltop repeaters with 5W or less.

---Joel

Bill, I know exactly what you are saying and I was triggering from
a sinewave signal generator at rates from 1mhz to 10mhz where the
scopes bandwidth becomes the limit of usability.

Most Tek scopes produce a trace that looks like a green laser beam.
This thing is like a 2AP1 or 2BP1 and lacks that normal Tek punch,
but as mentioned, it only has 1kv of acceleration potential so I am
guessing lame is the name of the game.

1 kv is pretty low indeed. I'm surprised Tek let it out the door.

Kerry-

I have three switching supplies: One from Radio Shack, one from MFJ and
one from Icom (PS-125). They all work quite well as far as delivering
rated current.

The problem is that the high frequency switching noise can be picked up by
an HF receiver. The Radio Shack unit is TERRIBLE in this regard. The MFJ
is fairly good and the Icom is the best. Even so, the Icom switching
noise is picked up if it is anywhere near the antenna.

I'm currently using a makeshift indoor antenna consisting of a dipole made
of a pair of mobile whips on the second floor. Because of the noise
problem, I've gone back to using an old Kenwood linear supply with my Icom
756 Pro II. This radio has the band scope, so you can see the noise floor
increase across the band when the switching power supply is turned on.

Not the point Joel. That 75 percent is the 3:1 signal to noise ratio.
Or rather noise to signal! 8^) It is there whether you filter it out or
not.

>
>>Besides - thinking that email is "High-Tech" is to start off with an
>>erroneous assumption.
>
>
> It's as "high tech" as SSB voice. :-)

Well, maybe a tad more H-T! I like to get people to think of other
things besides imitation. These days everyone looks at the Internet as a
high tech playground. And they want to fit "Internet training wheels" on
everything. When you consider what Hams are doing these days to get a
good wide bandwidth Internet connection across large distances, the
transmission of email on HF just seems a day late and about ten dollars
short.

What I would like is a digital HF voice connection that doesn't require
channelization (I'd like to be able to tune like I do with SSB) and not
have to know when the other OP starts transmitting. I also want that
digital voice to take up *less* space than SSB. I'd like SSTV that isn't
SSTV - I want real motion with small bandwidth. I want HF with a lot
less noise. It doesn't need to be FM, but I would like adaptive
algorithms that sort out the signal and pretty it up so that my poor
ears can make good sense of it without too much strain. I want my rig to

have a wireless interface to my computer and or other rigs in the vicinity. I *don't* want my computer to be my rig. If that happens it means I have to buy another computer because I use my computer for other things while I talk on my rig.

In short, I want the ARS to move into the future. I just don't think that email is that move.

808. Anyone built the 6146 cw/am transmitter in the 1966 Handbook?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-22 03:44:05 UTC
From: Jeffrey Bauman <jbauman2@earthlink.net>
Message-ID: <9cDAf.11050$ZA2.9910@newsread1.news.atl.earthlink.net>
Source record: 14159

I'm considering building the am/cw transmitter in the 1966 handbook (probably in others, too). It runs a single 6146 in the final.

I am curious if anyone has ever built that rig. If I build it, it will probably be with an outboard power supply, and a single switch for input / tank band switching.

Also curious: Anyone ever homebrewed a DX-60?

I am looking for a simple over voltage circuit for my 13.8V 20Amp power supply. I have googled it and found a few using zener diodes but some zeners can be off as much as 20%. I would like to have it activate at 15V or less. Thanks in advance.

Yes, I had better look. I thought though that inventory taxes take
effect on an increase in inventory... because otherwise you would
have to pay taxes on the same inventory year after year. Do people
really do that?

>
> The folks that actually do this stuff for a living (usually meager, but
> they seem to enjoy it) quickly learn that if you aren't turning over
> your inventory several times a year, that you aren't making any money.
>

Okay.

> Realistically the IRS may very well classify your attempted business
> activities as a hobby if all your components sit in boxes for years
> without getting sold.

Actually, I want to sell my used stuff and replace with new. I'm also
sitting on top of a pile of (s)crap that I hope I can use to raise
funds.

>And classifying it yourself as a hobby may be a good thing too, at least
>psychologically.

I just got laid off by an engineering company some months ago. I've
switched
roles with my wife, so that now I am a full time homemaker and parent
for my

two year old. That part is wonderful, but I want to make sure my prior skills
and drive will not go to a total waste. I have found the possibilities for
employment as a software engineering to be rather dismal to do the latest
mania regarding offshoring.

I'd rather go into business for myself and develop some type of
intellectual property, whether it be software, hardware, or
entertainment. To this end I filed papers to start
an LLC. I am going to elect taxation as a C corporation, because I want its finances
totally seperate from mine, reinforcing the liability shield. If a C corporation does not
earn very much in a short period of time but stays out of debt in the
long term, this is not a hobby, just a very slowly growing business.

> Some localities also tax personal (non-business-inventory) property and
> I also advise you to not inflate this number either!

Inflate nothing! I just want to know what the right thing is so that I can do
it.

> Important note: I am not in any way a business or tax advisor. But I do
> know (through the school of hard knocks) what I have to do to keep my
> hobbies/obsessions from becoming some stupid time-and-money-sink
> business model :-). That doesn't mean I don't do them, it just means
> that I keep them in a separate compartment in my head full of holes.
>
> Tim.

And I've got nothing better to do right now than to take what was my hobby and
try to make something out of it.. I have a fair amount of weekly time and the
rest of my life to decide what to do with it. I have plenty of (s)crap. I have
a little bit of money. But what I am suffering most from is a lack of
a decent idea.

Check out the section that begins on page 97 of this book:
http://www.onsemi.com/pub/Collateral/HB206-D.PDF (1.1 MB)

Looks like kind of a pain to find the MC3423 chip that they use, but the
principles in the book are still worth looking at.

I would probably use a bandgap reference and a comparator to trip the
SCR. An RC time constant on the voltage sample to the comparator would
be a good idea to prevent false triggering during startup, and to
improve noise immunity...

I checked on the Freescale site (it was a Motorola device) and it is no
longer made. They are probably still available, however, from surplus
sources.

That would be the day. What's the right price for your 8566B with manuals, etc.? I see Nick at Ridge Equipment has one up for $9k, but I doubt he'll sell it. Looking at the last 30 days, I see one fellow who had two "untested" units, accepting $3100 "best offers" for each, and another guy who got a $2700 "buy-it-now" sale for his "untested" unit with a "dim screen". All three "untested" units had photos indicating reasonable physical condition and some kind of apparently-proper display operation. There's another one, "as is" with a dark-screen photo, starting at $6499, with no bidders.

Win, I did a lot of digging and the best I can find is five glass
1N4004s. I have either used up all of the glass 1N4007s, or didn't but
them back into the right place the last time I used some of them. Are
they high enough voltage to test your circuit? If they are, E-mail me
with a shipping address, and I'll send them to you. I appreciate the
offer of the parts, but I am to the point that I don't feel well enough
to do anything at my workbench. It has been about 18 months since I felt
like trying to do anything, and most of my test equipment was water
damaged in the 2004 hurricanes. Its just too depressing to try to work
with what little is left.

How about a Zener with an SCR?
http://www.kbt-dc-supplies.com/crowbar.php

Crow Bar Circuit
This circuit can be added to any power supply that does not have it already. The value of the SCR should be whatever the supply is capable of producing as maximum output current. The way this works is sort of like this: The zener diode monitors the output voltage of the power supply.

When the voltage gets to 15 volts, the Zener diode conducts. In turn this fires the SCR and therefore short circuits the output of the supply. This then in turn, draws so much current that it destroys the AC input fuse. That is why it is so very important to use only the minimum rated fuse to get the job done. All this happens so fast that it stops any over voltage from reaching the equipment that is powered by the power supply.

The way we figure out what the value of the AC input fuse should be, sort of goes like this: As a rule of thumb, I divide the output maximum current by 4 and that is what I use for the value of the AC input fuse.

Those published statistics about the US education system have been
debunked as utter bull_sh_t! Some U of Arizona specialists dared to be
politically incorrect and reform the statistics on the basis of
percentage of students "living in poverty"- codeword for black. Those
schools with zero per cent, and there are enough of them, lead the world
in output of highly educated students. Even the schools with as much as
25% of student body living in poverty placed in the top ten. Then of
course as the poverty crowd becomes larger the quality of output
nosedives into the sewer.
Another very common misbelief of you engineering centric know-nothings
is that engineering education is somehow very tough- and at the personal
level I find that to be highly laughable- engineering eductaion is pure
recreation to those so-inclined. Anyone finding it to be a challenge has
picked the wrong course of study. There are other fields of study that
are far tougher and challenging than engineering.

I built a similar rig, but it was weakly based on that design.
Mine had a 6GK6 oscillator and a 6146 final. It was built inside
a chassis with the tubes mounted on a subchassis inside. The tubes
were "sideways" and holes were drilled in the chassis-cabinet for
ventilation.

I am assuming the same transmitter was described in the 1967 HB (which
was the first HB I ever bought). You might as well leave out the
AM modulator since it will be useless today. Back in '66-'67 there
were still some people on AM (mostly on 80 and 10 meters), but today
it's completly gone. Low cost SSB xcvrs wiped out AM by the mid 1970's.

I was thinking of building a simple rig again but with a 1625 in the final.
I have about a dozen of these bottles in the junk box along with half as many
6AG7's. The crystals will be the scarce items these days (well expensive
anyway).

Are you serious? The only phone I listen to are the A.M. gang- wonderful
rigs from the past on 3885, 7290 etc. There's someone on all day long- and
unlike the SSB gang, these guys know theory and are active builders/
restorers- perhaps the best that amateur radio has to offer today.

> 73, Fred, K4DII
Thanks for the info. I picked up one of the RS supplies yesterday, and
you're right, it's pretty noisy on 80m, especially on my longwire which
terminates inside the shack. On 40m and above and on the outside
antenna (dipole or vertical) it's fine and below my noise floor. I
found a mod for it with some toroids and caps across the output to
filter it a little, I'll probably try that but it's workable for now
as-is since I don't work much 80m.

It will keep me on the air until I fix the Astron, I'll probably put the
Astron back on the HF rig and use the RS switching supply on VHF and UHF.

I have to wait a bit later in the evening (season/band changes) and they can
be heard in Chicago area ... there is also the 160 meter gang .. and that
truly is like listening to late night AM broadcast.

==========
Don't understand what you mean with '2 oz copper PCB' ,but any fibreglass single or double sided PCB would be suitable , provided you don't put heavy stuff on it like PS transformers etc. If double sided make sure both sides make good galvanic contact at various locations.
I also like using PCB for (not too large) chassis and enclosures. Same material screens can be readily soldered-in. Another advantage is that where necessary components can be bonded to ground (chassis) directly.

==========
The quality of components from scrapped equipment can be doubtful
,especially when the said components are removed while being exposed to a
high temperature.
I do use components from scrapped equipment ,but only when I remove them
myself ,knowing how hot they were upon removal . If removal sometimes takes
rather long time , I discard the freed components .
Moreover I always check freed components for stability and if OK only use
them for simple (auxilliary) equipment.

Yeah. I have some extra instruments not doing anything, if you feel
well enough not to use that as an excuse. I get stuff real cheap on
eBay, and sometimes Harvard types are too proud to use it. And they
also give me stuff nobody wants. A perfectly-fine HP oscilloscope,
for example. Before anybody makes a remark, yes I've used HP scopes,
used them in EE lab years ago, and have a 500MHz 4-channel Infinium
plus an Agilent's 300MHz MSO on my bench now, so hide that smirk. :-)

> apparently-proper display operation. There's another one, "as is"
> with a dark-screen photo, starting at $6499, with no bidders.

It's tough to say. At the end of the day it's worth whatever the
second-highest bidder thinks it's worth. Ordinarily, I'd wait for all
those others to sell or otherwise disappear from the field before
putting one up for sale, but I think this one will out-compete the
others without any trouble... at least among buyers who know what
they're looking for. A dim CRT is not a good thing on these units,
because the focus is the first thing to go. By the time the emission is
down, you don't get a very clean image.

At any rate, a $9K starting bid on an 8566B with a DOA-only guarantee is
just a waste of a listing fee, and everybody's time to boot. Much
better to start low and encourage people to look at the item on its
merits. I'd be surprised if mine doesn't land in the $6K-$7K
neighborhood. $8K-$9K is a high but still-fair price, if someone has
the cash on hand and has been waiting for the right one.

That particular 8566B from Ridge does look clean, but it has some
serious phase-noise peaking going on. (Compare his CRT image with the
same shot in my auction, particularly taking the different reference
levels into account.) Even if you paid $9K for his, you'd still want to
open it up and poke around the first-LO synthesizer with an ESR meter.
Something -- probably something cheap but difficult to find -- is
packing up and getting ready to go out to lunch in that one.

> tank band switching.

Not that exact rig, but I've built similar 6146 transmitters. One gotcha with the oscillator-final setup is that you may not end up with enough drive on 21 and 28 MHz, if those bands matter to you. The Eico 720 improves on this by using a buffer/multiplier.

I like the Eico 720 design, but a weakness is lack of VR regulation leading to chirp (especially if you multiply up.)

The handbook transmitter doesn't include a clamping tube, so if for some reason you have no or insufficient drive you can find your final tube dissipating too much power and melting down. But, elsewhere in that handbook you will find several examples of clampers.

Bandswitching and plate choke resonances are easier to deal with if you limit yourself to 2 bands or so (say 80 and 40 or 40 and 20).

Every handbook from the late 40's up through the early 70's has a CW transmitter rig of similar spirit, earlier ones using a 1625 or 807 or something similar.

Tim.

Hello Mike,

> Doesn't necessarily, true enough. But I'd be willing to wager that
> in most cases it is exactly that, signing off.
>

I think you are right about the majority of cases. We see that a lot in nursing homes. People think that once they got Grandpa signed up there it's all taken care of and they can go about their business. There are people who haven't had a relative visit in months. No idea why. I mean, where else could you listen to someone talking about the great depression who has actually lived through it? It dashed his engineering career but he became the head barkeeper in a famous hotel where movie stars hung out. Lots of more stories. He passed away now and his grandkids probably never heard many of those stories. It's been a while but I still miss him.

Regards, Joerg

People are funny. I had a 2 MHz scope once, did lots with it. You can
use scopes well above their f_max with a simple envelope detector.

Hi Mike,

"Mike Coslo" <mremovethiscoslo@adelphia.net> wrote in message
news:GrqdndVNUIa-Yk_eRVn-ig@adelphia.com...
> Not the point Joel. That 75 percent is the 3:1 signal to noise ratio. Or
> rather noise to signal! 8^) It is there whether you filter it out or not.

I disagree. When you start finding that every e-mail message you receive takes a minute to receive (rather than 15 milliseconds), people start to become a lot more cautious with their e-mail addresses, and thereby inherently reduce the amount of spam to little or nothing. I'd wager that the Winlinks, for instance, receive nowhere _near_ 75% of their e-mail as spam; I'd be surprised if it's 10%.

> I also want that digital voice to take up *less* space than SSB.

Well, coding theory is very well understood these days, so you can certainly have it take up less space that the typical 3kHz SSB transmission if you're willing to start trading off quality for reliability (...both of which also trade off with power, of course).

> I'd like SSTV that isn't SSTV - I want real motion with small bandwidth.

Well, again, it's all a matter of tradeoffs. "Real motion in a small bandwidth" implies something along the lines of (1) lots of power or (2) lots of compression, which will break down for, e.g., fast action scenes. The problems you're citing here are exactly the same as what the cell phone guys have to solve, and believe me, there are lots of clever people working on solutions. Getting that technology transferred over to amateur radio is going to be the tricky part...

> I want my rig to have a wireless interface to my computer and or other
> rigs in the vicinity. I *don't* want my computer to be my rig.

You know that something like a Bluetooth interface on your rig would actually take up more transistors than a complete vintage-'80s computer like an Apple II or a Commodore 64, right? :-)

> If that happens it means I have to buy another computer because I use my
> computer for other things while I talk on my rig.

Sure, but with decent desktop computers (complete with monitor, etc.) going for <$500 these days, can't you just think of it as a "$500 rig accessory" and not a computer?

I didn't call it spam, as I said the topic does seem related to all
the groups listed. I didn't mean to sound TOO irritated, though a
large part of the thread degenerated into a debate over whether
amateur radio is still a viable activity in light of the Internet and
other things.

But I'm disappointed no one commented on the content of my post.
Perhaps I didn't quite know the operation of the things I made with
those kits, but I can fairly well remember the schematics, and of
course know NOW how they work.

Did anyone else learn anything from these kits???

> or less. Thanks in advance.

20% Zener tolerances probably do exist - but don't buy those parts!

5% Zeners (1N47xx series for example) are readily available for a few
cents.

For a little more money you can do a band-gap etc. but that's
overspecifying most of the time. The crowbar is there to protect you
when your pass transistor fails shorted, it's not there for any actual
regulation.

Tripping the crowbar at 15V when the nominal supply is 13.8V is cutting
it too close IMHO - that is less than 10% overvoltage. Look at crowbar
set points on commercial supplies - they are usually 20 or 25% above
nominal output voltage. Running it too close may very well result in
unwanted crowbar action with inductive/capacitive loads or load
transients.

Few loads will fry with 10% overvoltage, and some may malfunction but
few will fry at 25% overvoltage.

Tim.

Thats interesting, I wonder what mode I was using on 2m last Sunday
morning?.
It was an AM qso over a distance of about 90 miles, received an R5-S3
and gave an R5-S2. Both of us were running about 2.5w

842. WWV receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-23 16:39:46 UTC
From: Tobin Fricke <fricke@ocf.berkeley.edu>
Message-ID: <Pine.SOL.4.63.0601222137070.21828@conquest.OCF.Berkeley.EDU>

As a project to learn more about building radio receivers, I'd like to build a WWV receiver (or maybe a receiver for the Canadian station CHU, since it's nearby and the format sounds easier to decode). I'm looking for suggestions for how to design such a radio, reading material, etc.

I was thinking it might be easier to design a fixed-frequency receiver (rather than a tunable one) because I could just select the L and C in the resonant circuit to give the right frequency. Or, since WWV is at such "round number" frequencies, maybe I could somehow use a crystal oscillator?

thank you,
Tobin

You could build a direct conversion receiver with a crystal oscillator.

You might look at the Ramsey electronics 10 MHz WWV receiver kit. It's
a pretty basic crystal controlled superhet/ceramic filter/AM detector
with AGC.

Tim.

Are you looking to decode the data transmissions or listen to the voice
signals. If the former it may take something more sophisticated
because you will have to feed a decoder.

Well, I've been known to disdain HP scopes because their sync sucks,
and their knobs have terrible backlash, but at that price, hey, beggars
can't be choosers!

You already have my snail mail address - third or fourth class can't
be that expensive - I've gone some years without a scope - a couple more
weeks certainly isn't going to do me any harm! <hint, hint>

Thanks!
Rich

I've used H-P scopes, too. They're perfectly fine scopes if you don't need
triggered sweep[1]. Some of them even play games.

[1] even those old Telequipment units would trigger on *some* waveforms.

>I have about a dozen of these bottles in the junk box ....

When I find the right round tuit I want to use TEN 1625's with their
filaments series'd across the 120 VAC line in a simple CW rig. Can't
find it right now, but somewhere around here I have an article from
an old radio magazine describing just such a transmitter.

IIRC, the capacitance from ten tubes limited it to the lower HF band(s),
but it still seems like an easy way to get 750 watts!

I have the "Inexpensive 75-Watt Transmitter" from the 1964 Handbook.
It's a 12BY7 oscillator driving a 1625. I bought it on eBay a couple
of years ago, and it looks just like the one in the Handbook, with the
vertically mounted meter, coil shields and exact layout. For some
reason, it got painted black somewhere along the way.

I tried it out a few months ago, and should have reformed the caps.
Kerpow!!! So, I've got some work to do on it.

The 30 meter Vectronics direct conversion receiver kit can be tuned to
receive WWV. I built one, and before I moved the range up to the 30
meter ham band at 10.100MHz, I used it with WWV at 10.000 MHz to
calibrate my frequency counter.

So, you think that a single datasheet covers all manufacturers, and
all production runs? Once again, you show a great lack of
understanding. I have several glass 1N4004 diodes in front of me.

I built one around '62-'63 from the Handbook. It was ONLY a 6146 amp. I duplicated the osc/driver of the Eico 720 to drive it. I think the amp had a "gimmic* neutralizing cap. I'll probably find it in my mom's house when I have to sell it.

Yes. Many get an MBA and then get into electronics companies to screw all
the technical people and steal big dollars from the organization. Some of
the remainder become outstanding engineers.

Source record: 14063

I'm pondering building a 10 MHz CW xmtr. Single band would suit me,
10-50 watts maybe?. I wanna use tubes.
Am thinking about a 2-3 Mhz VFO mixing with an old surplus 7-8 Mc xtal.
I guess a guy could finagle a 2-bander (40/30) with ~8.5 xtal and ~1.5
VFO...hmmm, thats another thought.

Has anyone done something along these lines or maybe a 40/20 rig that I
could scale for 30 meters?

Just curious why you think the AM modulator will be "useless today" ?????
I'll have to tell those AMers running DX-?? equipment to stop talking into
the mic, right?

Nothing normal ever seems to happen to me... I did go out to get a 2nd headlight so I could get about 7.75 amps on it. I found a 1000uf capacitor that had a leg corroded so badly that apparently during the move it wiggled around enough to break loose. I went to the local Radio Shack (which, by the way, has apparently turned into a cell phone store) and they didn't have any 1000uf but they did have some 470uf caps so I put two of them in parallel to get close to see if it mattered. Pins 11 and 12 showed about 8 or 9 volts too low before but now they are right on according to the chart on the Astron schematic. I connected one headlight (3.75 amps) and turned on the supply. It showed 13.59 volts. Then I connected the 2nd headlight (4 amps) and it stayed dead on 13.59 volts. Looks like I'm in business!

Somebody has been into this supply before and butchered it, so I may clean up a few things while I'm in it. I guess I should fix that capacitor, the next guy in there will say the same about me if he sees 2 paralleled 470ufs instead of a 1000 uf!

THanks for your help guys!

73,
Kerry
WD5ABC
PS This post may look different, I'm on my Linux box out in the shack
tonight.

Well, the 60 kHz WWVB transmissions were designed to be decoded, and there
are a fair number of projects out there to do just that. However, depending
on where you are, you can typically only hear WWVB for a small part of the
day.

True, but his message did not make that clear. A receiver that tunes
to the HF voice signals won't work well on the LF band.

Allison-nospam@nouce.bellatlantic.net wrote:
> How about a simple one to three transistor regenative reciever.

In principle that's a great idea, but the gotcha is that very near WWV's 10MHz frequency there are a lot of powerhouse SW broadcasters. Here on the East Coast in the evenings, there are at least 10 SW broadcasters each of which are 10x more powerful all within +/- 100kHz of 10MHz, several of them within 10kHz of 10MHz.

If I fire up my regenerative receiver (my trusty old Space Spanner that my Dad bought for me when I was in 2nd grade!) WWV 10MHz reception does not work at all in the evenings due to those broadcasters, my particular regen just does not deal well with all those stations packed so tight together. The adjacent broadcasters block up the receiver or sometimes the regen locks onto them instead!

On 5 or 15 or 20 MHz, or on the west coast, the regenerative may welll work better. (There are SW broadcasters near 5 and 15 but not nearly so close and not nearly so packed.)

If the OP is looking for a build-it-yourself SW receiver for picking up the powerhouse SW broadcasters, then a regen is a fine choice. In fact my complaint is that my regen doesn't pick up WWV because of all those other broadcasters outgunning it here :-).

Ten-Tec and others sell really nice regenerative receiver kits for SW.

Tim.

The 10MHz band is so narrow (10.1 through what, 10.14 MHz?) that a
couple of crystals and some rubbering can cover it.

The VFO+mixer scheme is great for a multi-band SSB xcvr but the
complexity really isn't needed in a CW transmitter. Just build a VFO
straight for 10MHz, or double up from 5MHz (lots of 5MHz VFO plans in
all the handbooks) or triple up from 3.3x MHz.

Does a bigger antenna help? Or is there just so much more background noise
than signal that it's a lost cause?

Hmm... isn't the data rate something like 1bps? Maybe they could do some
direct sequence spreading at 100Hz or so and improve the link margin a handful
of dB... :-)

The trick with regens is to couple as loosely as possible. There is
enough gain in most regens that even a very loose coupling is enough
to overlaod and flatten out the selectivity.

At 5mhz I have no difficulty here is MA and at 10mhz it's still not a
problem. I've even heard WWVH from here when propagation was good.

Allison

The same time code is in the WWV HF signals as a 100 Hz, One Baud, pulse
duration modulated subcarrier tone. If you've only got a communications
grade speaker in your receiver, you may not notice it.

How easy is it to rubber a crystal in a tube oscillator?

(note to OP: If you use any of the older designs for a crystal
oscillator make sure your crystal can handle it -- the older crystals
were physically larger & could handle more power)

That's how I'd do it -- probably by tripling from 3.3x MHz, 'cause then
I could use the same VFO for other bands. One could, in fact, just use
one of the Handbook designs with the right coil set and possibly a
capacitor switched into the VFO to pull the frequency down a bit.

Well, I suppose it depends on where OP is. Here in the middle, 10 MHz isn't much of a problem but 15 is.

HOWEVER, 10 has one huge advantage -- there are very low cost uP crystals for 10 MHz, so building even a simple reciever with a brick wall front end isn't such a big deal, if the only frequency you care about is 10 MHz. Personally, I'd go with a DC rather than a regen - a lot simpler and these days, a simple SA612 will give you way more sensitivity than you can possibly use on 10 MHz for a couple bucks. Well, with a crystal filter in front maybe you will need a little amp, not so sure. But still quite a bit simpler than a regen. Heck, if the local QRM isn't too strong, I bet a 10 MHz uP crystal, a 612 and an audio amp (like a 386 or so) is all you would need.

A friend of mine did an article on a simple WWV reciever for QRP Homebrewer recently, issue #5 I think. He was more interested in the frequency standard than hearing the sounds, so his contribution was recognizing the zero beat, but still an interesting article if you can find a copy.

For wwv I consider DC the least useful. One approach I've also tried
is 9.6mhz crystal LO and use 455khz if can retuned to 400khz. that
works and uses fairly easy to get parts. That allows a diode
detector for zero beat against external sources and copy of the audio
without beats.

My facts are that I raised three children, who from the oldest to the youngest, got their degrees in chemistry, physics, and medicine (MD) respectively. I know what they and their friends went through in the several programs, and what their lives have been like since graduating. Only the medical students were treated like indentured slaves, and forced to work 16 and more hours a day during the internship and residency. My daughter, after completing her normal residency (internal medicine), opted for another year in a work/study program in infectious diseases. In her practice, she writes off a lot of billable hours for her patients. She doesn't do much more than break even with her costs many months. Her husband, a Urology surgeon has a higher income, but also writes off quite a bit. A typical workday is 12 hours, plus calls at home and some weekend work.

My other two children, and myself, worked hard at getting through school, but had lots of playtime. It was work, but not torturous as it was with the medical students.

I'm interested in both. From the radio perspective, I'll certainly be happy (but not satisfied) when I am able to hear the station's audio. However, I was thinking this would be a good project in part because it leads to the logical extension of decoding the time signals. My plan of attack is to first try to get the audio, then try inputting it to the audio input of a PC and writing a program to decode the time signal, and finally implementing some kind of microprocessor-based decoder.

What are these high-power shortwave stations on the east coast? I often
wonder what is "out there" these days to tune in.

Yes, that is what I was thinking. Is there a simple way to do frequency multiplication (or division) to get 2.5, 5, 15, and 20 MHz additionally, and thus be able to switch between all of the WWV frequencies?

"Brick wall front end"?

Incoming 10.000 MHz signal with a 9.600 xtal heterodyne oscillator will create at .400 IF frequency. If you had a 9.545 xtal then a .455 IF would add up to the 10.000 incoming freq. Six of one, half dozen of the other. Thats based on an easy to find crystal.

You asked in another reply about the other nearby signals to 10.000. There's plenty! The 9900-10000 freqs are in common use these days and there's a few powerhouses. I recall a strong BBC outlet on 9985 I think it is?

That said, on any receiver worth its salt they should not be an issue. I have no trouble at all with WWV on 10 Mhz on even simple 1-2 tube regen rcvrs at my location (KP4). Thats not a recommendation for simple 1-2 tube receivers in as much as to say that overloading is something to be considered. You might oughta try listening on a real receiver first to get a feel for the band and general reception capabilities at 10 MHz. You can get one of those cheapo Chinese digital shortwave radios nowadays for under $50, non digital for about $15-20. Not only will they reveal how well WWV/10 is received at your location but you may get a real-time example of overloading effects as well!

I'll recommend a little book that is readily available. "Secrets of Homebuilt Regenerative Receivers" by C.F. "Rock" Rockey. Its a Lindsay Publications book.
Rockey does a good job at simplifying the simple :) Basically the concept of a regen is feeding the output back into the input for reamplification. Theoretically its a somewhat infinite process in that the reamplification continues repeating itself resulting in very high gain at the particular frequency the set is tuned to and thats also where the selectivity improvement comes from.
Its similar to oscillation in a tube.

The coupling issue mentioned by Allison is related in the sense that heavy antenna loading will decrease the circuit Q and consequently decrease its selectivity as the regenerative signal makes its round-trip thru the circuit. That opens the window for strong stations that are well off frequency to easily overload the circuit as a whole due to the high magnitude of amplification. You'll see some circuits with direct antenna connections to the tank circuit (bad)...some use a separate antenna winding on the coil (better) some use capacitive coupling to the tank...some use a combination of both.

Easy enough to build one for grins...might not be as stable as you would want for your decoding project but would be a good, fun exercise just the same.

GL,
Bill

If the problem is more or less random noise, what is the point of
spreading the transmit signal, since the same noise density would
appear in a specific bandwidth after despreading.

> And lose the ability to be used as a frequency standard?

The GPS signal is DSSS and it can be used as a time and/or frequency
standard.

Hey, Man, I don't know about TEN 1625's, but I did try five 1625's (in
parallel, of course) and could work up to 40 CW..... (as an American in
France, F7CT). Almost 1000VDC on the plates, and they did get pretty rosy
on a long "dah". 1625's could be drawn by the basket full from the MARS
storeroom at Toul Rosieres Air Base, France. 1962.....1963?

Oh yes, I remeber that! it was dubbed G-Line from its inventor, Georges Goubaut, canadian I think.
that line has very low losses and can operate wonderfully. However, in this case it's going to be hard to couple the cavity to such a line.
the Gunnplexer is phase sensitive and needs circular polarized antennas to operate correctly. I would suggest that a better approach would be to waterproof the whole thing and locate it on the tower, going down with cables on the low frequency side. I used to peel off the mica window found on old kerosene burning heating stoves and ose that with a few dabs of RTV to waterproof the cavity opening and put the whole on the roof.

You may want to consider this little regen receiver project. The board
for it is available from Far Circuits for around $5, or you could make
your own board.

I'm going to buy a rotor for my flag antenna. I have a rotor now but it is
one of the old TV antenna rotors with a control unit that goes klunk, klunk,
klunk,
as the antenna turns. I'm hope newer rotors have quiet control units.
It doesn't have to be heavy duty the TV antenna rotor has worked fine.
What are some rotor suggestions?

P.S. Has anyone built a quiet control unit for the old Alliance U-110 rotor?
My rotor works fine, but the klunking at midnight bothers my wife!

Mike

Sorry, I meant "Homebrewer" rather than "QRP Home brewer". The AmQRP rag
rather than the now-defunct NJQRP mag.

You're probably wrong, of course, as Michael Terrell points out,
but I'll have to admit that's an impressive list, and I love the
manufacturer's logos, 26 of them, all lined up. Sigh, I only have
datasheets from 20, stored in my computer. But, I have them from
Won-Top, Leshan Radio, Gulf Semi, Formosa Micro, Dachang, and
Bytesonic, to name a few they don't have, SFAICS. Plus, I have
multiple versions from several of the companies. So there!

So many files, so little time.

Correction, they had Leshan Radio, listed as LRC. What a great
site,** now I have 1n4000-series data from 35 manufacturers.
That's got to be a record. Maybe I can stop now. [smile]

** They do append their own announcement page, "This datasheet
has been download from: www.datasheetcatalog.com - Datasheets
for electronics components." but at least it's on the last page.

I would be interested in hearing and seeing examples of very small workshops (closets/small apartments/small bedrooms) and how people have adapted a workshop to a very small space. Pictures or links to pictures would be great. I would think the challenges of lighting, ventilation, power and space would create some interesting solutions. Any articles that discuss this subject would also be welcome.

Thanks for any contributions you might offer.

WOW, too bad I didn't see this about 20 years ago. Three experiences - I had a back room in our basement - the house being 4 rooms - small at that. The room I got was like 5'4" high, which I had to duck to walk into as there was a step up into it - were it flat with the rest of the basement - I'd have had no trouble. It was about 6' deep from door to back wall and 5' wide. I had two very small tables in it, a chair and used the small nooks and crannies for storage. The one table being my bench. I was crowded - but I can say - all was in easy reach..... I even had a stereo there for music, bright lights for total illumination, and a few other nice additions. In another home I lived in, I had a small closet for my workbench "and" Ham shack, we were in an apartment building, no basement and the new bride didn't want to see the stuff. Crowded as much as if not more than my room as mentioned above, but hey - it worked for the time. There is something to be said about those close quarters - one thing as I mentioned, all in easy reach. I have a lot more room now, but I DO sort of miss those days! It just goes to show, you adapt when you have to. The more room you get - the more junk you tend to rack up.... As to lighting, I addressed mine as mentioned. Ventilation, it could get stuffy, if soldering a lot - if working on tube equipment, it could get warm. And, if ya ate something good for dinner, you could stink yourself out too! Power - you tend to utilize all sockets and pipe some in from outter rooms if need be. It isn't the end of the world having to deal with such an issue. As they say, ya gotta do - what ya gotta do..... I've even had my work areas when staying in a 26' camper - utilizing - again, any available space. Actually - it can be neat! Its all in how you lay it out and approach it in your mind. One thing - DO NOT block yourself in - in case of fire or shock hazard. Take any appropriate precautions against fire and so on.

Hint for increasing storage space where there is little wall space
available.
For doubling the storage capacity of an existing
wall of steel cased,plastic drawered component
storage cabinets.
Obtain some extruded aluminium channel sliding
door gear used in domestic clothes cupboards etc.
Fix the runners to the top of the cabinet/cabinets.Fix channel to
ceiling/stout shelf in
front of and above(to avoid fouling top layer of drawers) the existing wall
mounted cabinets.
Fix a couple of PTFE slabs to base/rear to run against a sheet of wood or
metal fixed under
the existing units. Cabinets can be doubled up,pop-rivetted together
vertically with bridging
plates across the joins. Even trebled up if heavy components are placed in
the wall mounted units. For every
3 existing units maximum of 2 sliding ones for access,for 4 fixed then 3
sliding etc.
Theoretically 2 layers of sliding and 1 layer fixed cabinets would be
possible.

Other than the obvious comment - more mains outlets,
anyone any ideas for avoiding the rat's nest of knotted mains leads to
numerous test gear hanging around for perhaps once or twice a month use, so
not on a shelf
for once a year use. ?

Guilty m'lud. However I dont see what the challenges are exactly.
Lighting is the same as anywhere else, except you'll only have 2 lights
on at most. Ventilation, I assume it has a door and window. If not, it
still has a door... one hopes!

Power is simple enough, just flex and multiple sockets, route the flex
wherever it can go. Modern 4/6/8 way sockets have made this very quick
to implement. Wiring them in pairs makes them usful, 4 outlets isnt
much use. Shortening leads can avoid a whole lotta wiring mess. 2x IEC
leads in one plug tidies things up too. Many British plugs will grip 2
flexes happily, though not all.

Space... it all follows simply from one basic concept: storage
effciency. Storage efficiency is the volume of goods divided by the
volume of space its stored in. If you have say a 2'x4' table, and have
1 foot depth of kit on it, and another 1' underneath, your efficiency
is 2'/8', 25%. (8' is the floor to ceiling height). Always store from
floor to ceiling, any unused space is not good. Using standardised box
sizes makes for better packing than odd sizes.

Theres nothing difficult about working in small workshops, as long as
you dont care about neatness, order, and dont mind working with goods
stored overhead, wires running up table legs, narrow access passages
and so on. Forget about swivel chairs.

Dont forget to make the storage boxes as frogs legs, heads, arteries,
etc. It keeps visitors at bay.

one last point: you wont see pics of small workshops. Its not possible
to capture the whole shop, or even much of it, from one camera
position. And to see anything you'd need a very wide angle lens, which
most people dont have.

Can't get a picture because it was in my previous house...

Six foot wide closet with folding doors.

Bought a pre-made Formica kitchen counter at Home Depot, notched it to
fit and dropped it in as my bench.

Multiple outlet strip across the back. Parts cabinets above.
Fluorescent fixture above, plus a small goose-neck for close-up
illumination.

Close the doors and you weren't aware it was there... wife loved it
;-)

Now-a-days I solder maybe twice a year... haul out scope, signal
generator and DVM, and just do it on my office desk.

Best thing I ever did was to use kitchen tops for the workbench.As
they have a sloping edge,I placed two together with the slope abutting
in the middle to form a V shape.
this has caught more dropped screws etc also a good place to lay
screwdrivers etc to stop them rolling off the bench.A good safety
idea,well at least for me.regards

I've just picked up an old Heathkit HD-15 Hybrid phone patch. Can someone tell me whether it's possible to set this up apart from ham gear, simply to record telephone conversations, and if so, how? I need a way of balancing the local and remote voices and figured perhaps this old phone patch can be put to a slightly different purpose...

>>are a fair number of projects out there to do just that. However, depending
>>on where you are, you can typically only hear WWVB for a small part of the
>>day.

For information on the WWV, WWVH, WWVB time codes and signal
strength, go to: http://tf.nist.gov/timefreq/index.html

From the coverage diagrams (every 2 hours), most of the
contiguous states of the USA get sufficient signal from
WWVB in any 24-hour period. That has been observed here
(Los Angeles County) using a 2 1/2 foot diameter loop;
distance to Ft. Collins is roughly 800 miles (?).

By actual test, my LaCrosse radio wristwatch was able to
sync on WWVB on an auto trip to Wisconsin and back over
September to October. Typically such radio watches only
begin checking/syncing after midnight local time. The
internal quartz timing oscillator remains stable (for
time indication) within one second in 24 hours.

Radio clocks are consumer electronics items that typically
cost $20 to $30 (depending on display size and extras such
as local temperator). If all that is wanted is automatic
time setting, it may not be a good return on time
investment to build one's own automatic-setting clock.
Those radio clocks aren't much good for zero-beating a
local frequency standard except: If the local standard
is counted down to 1-second pulses for comparison with
the radio clock (arduous process to check).

>>The same time code is in the WWV HF signals as a 100 Hz, One Baud, pulse
>>duration modulated subcarrier tone. If you've only got a communications
>>grade speaker in your receiver, you may not notice it.

There was once a KIT for a WWV time code receiver (Heathkit?).
As memory serves, it cost about $400 just for the kit! That

was in much older days before 25-cent 74LS00 chips.

The original requestor wanted a WWV receiver, presumably to zero-beat a local crystal standard. ANY HF receiver will do for that, but preferrably one whose S-Meter can show very slow beats (well below 100 Hz). As another suggested, a cheapo import SWL receiver can do that, adding only a metering connection to the internal AGC line (for the slow zero beat). Bandwidth of the IF is not of great importance since the time-frequency bands are wider than the usual cheapo receiver IF bandwidth.

In the northern Los Angeles area, I've never had a problem picking up either WWV or WWVH on 5, 10, or 15 MHz, even with a few feet of hook-up wire as an antenna. That's over a 42 year residence in this same house here. The time ticks are good for checking progressive aging of local frequency standards which are counted down to 1 second output...that compared with the time tick in delay...and delay change (to indicate very slow changes in the local frequency standard).

The time tick method was once the ONLY precise way to check out local L.A. frequency standards when WWV was located back east. That preciseness was to better than 1 part per million.

A simple TRF arrangement tuned to 5 MHz will do the trick for a receiver used solely for zero-beating and hearing the voice announcements and time ticks. The interstage tuning will be stable enough to pick up WWV or WWVH. To get 10 or 15 MHz carriers, add a mixer to the antenna input with a local oscillator of 5 and 10 MHz. A local frequency standard can supply that; no extra LO crystals required. Four stages tuned to 5 MHz with Q = 100 will result in an overall TRF/IF bandwidth of about 20 KHz, quite adequate for WWV/WWVH.

Take a look at Fig 24 and Fig 25 in the data sheet for the TL431.
http://www.onsemi.com/pub/Collateral/TL431-D.PDF
Very accurate, cheap, and simple.
The TL431 is available in a TO-92 pkg.

The Gunnplexers I have owned (AR I believe) were linear polarized.
With those, it's just a matter of getting waveguide to the antenna- this may
not be cheap especially if you need flexible transitions.
Tower mounting obviates this but temp variations will move the Gunnplexer
all over the place.

You might try and find a user manual for the old Heathkit GC-1000 Most
Accurate Clock.
It synchonizes the clock and local oscillator to the WWV transmissions
at 5, 10 or 15 MHz. The kit came with a preassembled and prealigned RF
board but you still had to assemble the data recovery and other parts of
the unit. The manual includes full schematics (including RF board) and
a good theory of operation section. The only thing missing are
instructions on aligning the RF board. The silly thing works pretty but
I had to build an antenna and install it in by attic to get it to
sychronize reliably.

What is Ham Radio?

(Preface)
It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery. Even
the Usenet newsgroups dedicated to the cause have degenerated
into a hotbed of abusive onslaughts by those who ought to know better.
However, there still exists the fundamental basis on which Ham
Radio is based, and that will never die. This FAQ ("What Is
Ham Radio?") will be regularly published and will not be
shouted or bullied down. It is important that those of a
technical bent, who are the natural seed-corn of Radio Hammery
and who gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_
to you to exert yourselves to join our fraternity! (If you find
otherwise, then perhaps you are already classing yourself in the
mediocre groups of those who are criticised in the FAQ and from
whom we _MUST_ dissociate? If so - it's never too late for
a re-taxonomisation on your part - there's nothing elitist about
us, and we welcome all those who are prepared to put themselves
out in order to join our ranks!)

-----ooooo-----
(Article)
So,.....What is Ham Radio?

Ham Radio is a technical pursuit for those who
are interested in the science of radio wave
propagation and who are also interested in the
way that their radios function. It has a long-standing
tradition of providing a source of engineers who
are born naturals.

Ham Radio awakens in its aficionados a whole-life
fascination with all things technical and gives
an all-abiding curiosity to improve one's scientific
knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience
with ones fellow man, and shows itself in the
gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that
they can construct and operate their own equipment! No-one
else has this privilege. Users, such as broadcasters,
the po lice and armed farces, CBers and mobile phone
users have to purchase ready-made gear. Manufacturers
are not licensed to operate their gear. Radio Hams
are qualified to design, build and then
operate their own pieces of equipment. They do this
with gusto, and also repair and modify their own
equipment. This is a privilege well worth the effort
to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with
relatively simple technologies at first, perhaps making
his own Wimshurst machine and primary cells. Small pieces
of test equipment follow, possibly multimeters and signal
generators. Then comes receivers and transmitters. It is with
the latter that communication with like-minded technically
motivated people takes off. The scope for technical
development grows with the years
and now encompasses DSP and DDS. There is also a great deal
of excitement in the areas of computer programming to
be learnt and applied.

The technical excitement motivates Radio Hams to compete
with each other to determine who has designed and manufactured
the best-quality station. This competitiveness is found in DXing,
competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a
desirable thing to have that there are large
numbers of people who wish to be thought of
as Radio Hams when, in fact, they are nothing
of the kind! Usually such people are a
variation of the CB Radio hobbyist; they buy their
radios off the shelf and send them back to be
repaired; they are not interested in technical discussion
and sneer at those who are; they have no idea how
their radios work inside and have no wish to find out;
they are free with rather silly personal insults;
they have not satisfied any technical qualification
and their licences prevent the use of
self-designed-and-built equipment.

These CB types engage in the competitive activities
with their Cheque-Book-purchased off-the-shelf radios
in a forlorn effort to prove that they are Radio Hams.

No _REAL_ Radio Hams are deceived by such people!

-----ooooo-----

One such CB type is the so-called "Not-Ham". Otherwise
known as the CBer-Masquerading-As-A-Radio-Ham, this type
had their background in the hobby that is CB Radio and not
in the technical pursuits that lead up to a coveted Ham licence.
Easily recognised by their boasts of the criminal activity of
11 metre SSB operation, one wonders why they don't go back to
the CB Bands if such bands are dearer in their hearts than are the Ham
Bands? No _REAL Radio Hams associate with those who made an
illegal installation of transmitting equipment before being
in possession of an appropriate licence.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist
from the _REAL_ Radio Ham is to solicit their view of the
difference between CB Radio and Ham Radio. A Radio Ham will
perceive Ham Radio to be a technical pursuit and will
perceive CB Radio to be a social communications facility
no different in essence to a land-line telephone or a
GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
could also hold a CB licence safe in the knowledge that
such a licence says no more about him than having a land-line
telephone, whilst continuing to regard Ham Radio as a separate
technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between
a Ham Radio licence and a CB Radio licence. To him, they are
sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then
tries to classify himself as the equal of the Radio
Ham when, in fact, he is nothing of the kind. A sure sign of
a CB Radio hobbyist is if he holds, or has ever held, a licence
issued under the gangrenous degeneration that is the
M3/CB Fools' Licence scheme.

-----ooooo-----

One group of people who claim to be of the standard of
Radio Hams but who are in reality nothing more than an
apology for the failure of a CBer are those class B
licensees who falsely proclaimed that they were against
the use of a Morse Test to control access to the HF
bands, until, that is, a test was introduced at their
intellectual level, the intellectual level of 6-year-olds.

6 year-olds simply lack the mathematical tool kit to
enable them to handle even the simplest algebraic manipulation
for Ohm's Law and thus, the disgraceful Class Ber's in
the aforementioned category are not Radio Hams by any stretch
of the imagination!

Remember - A sure sign of a CB Radio hobbyist is if he holds,
or has ever held, a licence issued under the gangrenous
degeneration that is the M3/CB Fools' Licence scheme!

Gary, I was not commenting on the OP's statement, but the responders
question about capacitors in "SERIES".... If you will notice, in the
header of his responce, he is posting from ksu.edu which is a university.
Therefor he is either a Student, Professor, or Staff at that institution,
and should have known better, than to post such a STUPID Reply.

I notice that his Reply, also went right over your head as well, because
you didn't seem to realise that his "SERIES" comment was really LAME.

Just goes to show that even an Extra Class, can't read acuratly all thew
time......

What makes you think that a janitor, who happens to be employed at a university, would know the difference between series and parallel capacitors?

Hi all,

I got an Emtech antenna tuner kit for Christmas, but it's the BNC version and my shack is normal SO whatevers. I emailed the company weeks ago to ask how to exchange it, using the address on their website, which is on their mailing label. I got no answer. So last week I called. I got a generic phone company voice mail answer. ("You have reached [number]. Leave a message after the tone.") I left a message anyway. No answer to that either.

What's the deal with these people? And if they've folded their tent (but not apparently their sales department) is it just a matter of buying UHF connectors and swapping out the BNCs in the instructions? (This is my first homebrew project.)

Thanks,

Rob, KB7PWJ

What's the problem ; just get a BNC to SO 239 adaptor or make a short lead
with the appropriate connectors.

Okay Don, if you thought that my post was mindless, then perhaps you might go back and read it.

As a refresher and to paraphrase, I noted in this thread that Winlink is a day late and about ten dollars short. Getting email via HF radio is not high tech, not a good use of spectrum, and there are plenty of other technological achievements that would be of much more use to the ARS than that.

If you still think that that is stupid and pompous, then so be it.

Connector losses are a serious issue in the GHz region, but since the
OP is talking about an antenna tuner, it appears that the usage is for
HF, this is not really an issue.

Extra connectors are a reliability issue on the long run, so replacing
the connectors on the tuner is a good idea if a thick coaxial cable is
to be used. For RG-58 the BNC is quite adequate.

> So, am I right? John was not surprized (price) and Win is now the owner?

Correct. $6,380 after 16 bids from 12 bidders. I started the bidding
at $1.00, "aikidoka.steve" stole it from me with $2.00, and the battle
was joined. Last night electron55 took it from calibrate72pb with his
$6,280 bid at 18:29:44 and I outbid him one second later, 15 seconds
before the auction was to end at 9:30pm EST. My sniper service placed
a bid nine seconds later, but it wasn't needed, I was already a winner.
:-) http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=7583597242

I also grabbed John's 8568A 1.5GHz RF Section for $610.

These beauties will replace my inferior HP 8569B spectrum analyzer.

1. Webster is a Yank dictionary and not an English one, so the
question is irrelevant.

2. Dictionaries do not prescribe they merely describe so the
question is, once again, irrelevant.

3. If it seems that I am being intolerant towards those who are not
Radio Hams by any stretch of the imagination, then, good. That
was and is my intention. We should guard jealously the privileges
that we have and stand apart from those who are simple appliance
operators and simple-minded CBers and who are indistinguishable
from the man-in-the-street with his GSM phone or CB walkie-talkie..

4. That said, I warmly encourage, as I have always done, everybody
without exception and without prejudice to exert themselves to
join our ranks. There is no snobbery in a wish to maintain standards.

5. Radio Hammery is a technical pursuit and I wish for it to always
remain so.

6. Whoever you are, I am critical of you for originating personal
remarks. There is no call for such. Ham Radio has traditions of
international gentlemanliness which seem to be lost on you. I am
not familiar with the Yankland licensing scheme; Is "KC7GR" some
form of CB licence?

Well I havn't heard any AM on the HF bands in a long time, but I stand
corrected that some people still use it. Granted it's in the minority
and on "calling frequencies". I don't think those screen grid modulators
found in novice rigs were of much use though. They didn't have
much punch and poor audio. If you are going to go AM, a real plate
modulator is the only way to go. (I shudder to think what a plate
modulation transformer would cost these days....)

I remember having a Gonset 2m communicator I as a novice.
Is there any am left on 2m? Can those new multi mode rigs
even transmit on am?

I never said AM doesn't have it's place. It's gone as a DX mode,
but on a quiet band is great for rag chewing.

Let's see... the output C of an 807 (1625 is the same) is 7pf, the input C
is 12pf. With 10 tubes thats 70pf output and 120pf input. Won't work
at all on 10m, and iffy on 20. Would be fine on 80 and 40.

Hi there group,

I have obtained an old microwave receiver made by Yaesu called YM-400.
It also has a yaesu label and look somewhat like a yeasu cover. I have
found a little bit about it in old 80's 73 mag

Looking for an information to understand it, maybe put it up.

Looking forward to your post!

984. Cheap AM chips

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-29 06:12:15 UTC
From: Frank <Frank.22e2wa@news.radiobanter.com>
Message-ID: <Frank.22e2wa@news.radiobanter.com>
Source record: 13984

Hi All;

I just bought 75 LM3820 chips from B.G. Micro for 12 cents each. You have to buy tubes of 25 chips. The chips seem to work great, I'm using one yellow IF can from a pocket radio, and two 455khz ceramic filters in the IF. I used an FET detector stage, and there's enough audio level to drive the line input of a boom box that I was using for a quickie amp. I don't know what the upper limit is of the oscillator, but I had it up to 13 mhz with no trouble, at least after I figured out the scope probe was loading down the oscillator, and stopping it at 5 mhz.

The pin out in the original data sheet for the LM3820 seems incorret, or maybe just confusing. I couldn't get those configurations to work. I had an app guide for the LM1868, which was using the LM3820 for the AM side of an AM/FM system. Those connections shown were considerably different from the LM3820 data sheet, and it works! Both data sheets show a tuned RF input circuit, but I'm using just a six foot wire, and it works ok on AM.
I'm using voltage tuning, using the NTE618 as the capacitor in the AM oscillator. I haven't tried it on short wave yet, that's tomorrow's project. I mainly want the 39 to 31 bands, but may play with using it on the HF ham bands.

I can e-mail the schematic if anyone is interested, it might be easier to follow than the data sheet. It's an old chip, but the price, and ease of use attracted me to it.

Frank

Smart lads, well done, but no cigar!

My mate 'idi' got chucked out by his wife (oh how we laughed) and has
been staying with us for a while. He's now been forgiven (but never
forgotton) and is back in his own drum getting in the ear on how he
must keep away from other birds! :))
Also he was a bit too fond of my gold watch.

I'm very impressed with you Mike, there's a job waiting for you in the
FS if you fancy it. ;)

Idi and I are both very big fans of Gareth Evans having met him some
time ago.
At the time I remember saying as we left "That blokes an absolute james
hunt and needs locking up in a bin"

Keep your noses clean everyone and remember that old Jack can read NNTP
ips plus a bit more.

And before I forget

SHUT IT EVANS.

Walt, you are obviously an intelligent person of high IQ with a broad background of knowledge.

But your contributions to newsgroups would be better appreciated if you refrained from the many inconsequential, shorties, which waste one's time bothering to look at. Your own valuable time is also wasted.

But please do continue, preferably without shorties, to educate us.

Reg.

I have none. Just the shopkeeper who sold me my first rig said so. I'm sure
I can rig up some old crusty adapters to do so. :) All the same, I would
want to keep the adapters out for other reasons.

Have to agree there Ken as I have had a few screen jobs in the "good old days". They weren't good for too much only to get on phone for a youngster who didn't have the bucks for a SSB or plate modulated rig. My old Globe Chief had the screen modulator but did not perform well at all .

Message-ID: <7mpDf.23$M_7.2@fe06.lga>
Source record: 13910

While I haven't built that particular one, I have built a similar design of Peter's with good success.

There are some possibilities ... Peter relies on timing for the LCD. If your crystal frequency is higher than the frequency of the hex file you downloaded, or if your LCD is a little off (common if you got the LCD from a hobbyist source) then a blank display or a display of all black squares would be a common result. Check to be sure that the version of the hex file you downloaded matches your crystal frequency.

Mag's site is incredibly slow and I haven't located the source, but he at least has the wiring to avoid being dependent on the timing. Whether he did or not I can't tell without seeing the source. Reading the LCD to tell whether it is ready, instead of waiting "long enough" is fairly uncommon because different brands of LCD seem to respond a little differently, but maybe you just got lucky.

I would try slowing down your clock a bit as a test. This will give you an incorrect frequency readout, but it would let you know whether timing is the problem. One thing about LCDs -- there is no such thing as too slow, so if the only other crystal you have lying around is a lot slower, it will be fine for the experiment. If it turns out this is the problem, simply increase the LCD delay in Peter's source.

..

Oh duh!

I just looked again ... Peter and Mag wire the LCD differently. RS and LCDEN are swapped on the two circuits, so if your circuit works with Mag's code, of course it won't work with Peter's.

Thanks for your input.

I see them wired identically and I checked a few times!
And I am using a 4MHz crystal.
Which version are you using?

My LCD is a standard 2x16 one and the Mag display is broken on 2x8 lines.

Did you compile Peter's source code yourself?

JJ

Not quite. The LCD enable and Register Select lines are swapped between the two circuits. Look carefully -- it is confusing since the R/W line is the same (and it is between the two). Now, all I had to go by was Mag's schematic and Peter's source code. I didn't find either Mag's source or Peter's schematic. But Peter's source does expect LCDEN and RS to be on the opposite pins to Mag's schematic.

> And I am using a 4MHz crystal.

I am using a 10 MHz crystal, but I modified Peter's code to accomodate that

> My LCD is a standard 2x16 one and the Mag display is broken on 2x8 lines.

It's a pretty simple fix to deal with the 2x8. Most 1x16 displays are 2x8 with the two lines side by side. Mag has to add 0x40 when he gets to the ninth character. Just drop that add and you're good to go.

> Did you compile Peter's source code yourself?

Yes. Back whenever it was I first started playing I may have used his hex file, that was a long time ago. But I can't resist the urge to play mself.

We must be looking at different diagrams. I have f84 pin 1 connected to
LCD 6 and f84 pin 17 connected to LCD 4 on both designs.

What I did was ground LCD 5. It worked for the Mag but not Peter's
program.

Which line or area in LCD4CNTR.ASM can I find this extra 0x40 to remove?

Well I recompiled it for me and it works. I will try Peter's hex file
again to see if thats faulty.

Thanks again for the tremendous help.

"One group of people who claim to be of the standard of
Radio Hams but who are in reality nothing more than an
apology for the failure of a CBer are those class B
licensees who falsely proclaimed that they were against
the use of a Morse Test to control access to the HF
bands, until, that is, a test was introduced at their
intellectual level, the intellectual level of 6-year-olds. "

Hold on a mo. I'm a class B licence holder - G8LIR, and have been for,
oh about 30 years I think. My main interest was in fast scan ATV on 70
Cms and 23cms, and with a small team we competed in many ATV contests,
setting new (and I think unbroken) records. All our equipment was home
built - yes I do mean ALL - including narrow band ATV receivers
utilising inline cavities and integrating receivers to subtract noise
and reveal lost images when only a weak sync pulse was available. We
also DESIGNED and built the linear amplifiers using 4cx250's in push
pull, with 2kv on the anodes and tuneable cavities (not copied
designs). And, oh yes, we designed filters using laplace transforms to
calculate the correct vaues for the inductors, wound them ourselves and
tuned then with second hand spectrum analysers.

Now to me, that level of technical expertise speaks to a certain
intellectual level over a 6 year olds.

I was considering returning to the hobby, but frankly the view in this
FAQ has put me off.

Anyone care to comment ?

Andy

I made a error in my post.
The program that is working is the LCD4DIEC.asm and not LCD4CNTR.asm.

Now that's a real puzzle.

JJ

If you look at the code:

```
movlw LINE1 ; continue at right half of display
iorlw 080h ; Function set
call PutCMD ; Position cursor leftmost on first line
```

under the label NoDot, this code moves the cursor to the second line. It looks as if all you will see on the second line is the string " MHz" (leading space). Anyway, comment out these three and the " " should get written after the last digit instead of on the second line.

Looking more closely at this code, Peter does use the busy flag -- I had looked at his initialization code where he only uses timing, but when he goes to write, he checks the busy.

Up at the top of his code, the lines:

```
E equ 2 ; LCD Enable control line RA2
R_W equ 0 ; LCD Read/Write control line RA0
RS equ 1 ; LCD Register-Select control line RA1
```

set the pins for LCD enable, R/W and Register Select. If you look at Mag's schematic, he places RS on RA0, RW on RA1, and E also on RA2. Peter's comment above those lines would lead you to suspect that they were on PORTB, but he actually uses them on PORTA. If you swap the connections to LCD pins 4 and 5 Peter's code might work.

The person who wrote the so-called 'faq' was himself a B licensee for many years, before taking the morse test and getting an A. The excuse he trotted out for this - after much prompting about the more-than-a-decade gap between these two events - was 'an interest in VHF/UHF techniques'.

Unfortunately for this belated post-justification, he has never published what he accomplished in that extended period.

It is said that 'empty vessels make the most noise'.

If you want to return to the hobby, then do so and enjoy it. Do not be put off by someone who doesn't believe there is such a thing as 'slope detection', or who sold an FT-101 because the tune-up pages were missing from the manual.....don't ask......

Yes, indeed.

You can discount without loss anything the writer of that so-called
"FAQ" has written, is writing, or will ever write. He attempts to
demean people who have attained heights he can't even see, much less
comprehend. He has nothing to say, and insists on doing so at length.

Don't let him put you off anything. Jump in; the water's fine.

You will probably be best off winding your own. My advice is this:
find the core size required to handle an amount of power at 60HZ equal
to the audio power needed, find an old power transformer of that core
size, and unwind it. Count the turns on the 117VAC winding to get turns
per volt, and figure the wire size from the DC input to the modulator
for the primary windings, and from the DC input to the PA(for each
side), and turns from the turns per volt for power. Do not push wire
size the the limit(small) becuase the windings also must handle the
peak currents produced by the audio power, which are higher than the DC
average.

This transformer will have more than enough iron in the core to handle
the AC power, as audio is at a higher frequency and the inductive
reactance higher. DC in the secondary will lower the inductance, but
you should still have enough. If you were trying to handle deep bass
frequencies(not needed nor wanted in a "communications" app as they eat
percentage of modulation), you would use a still larger core, figuring
audio power PLUS the power represented by a 60HZ AC current whose RMS
value is equal to the current drawn by the PA. This "overkill"
transformer would give less distortion on deep bass.

For a ham or any other communications application, frequencies below
300 HZ or so are far less important than they are to a broadcaster, but
be SURE not to allow frequencies to pass the modulator's driver that
the output transformer is not efficient at, or heavy currents will be
drawn and efficiency will suffer badly. If you design a modulation
transformer only to handle a narrowband voice range, the modulator
input transformer should also reject any frequencies lower than the
output transformer can handle, or these frequencies can be filtered out
elsewhere.

Otherwise, just speaking too close to the mike(which produces a deep
bass response) will heat up your modulator.

I did that, now when there is a dot the display shows the frequency twice
on the first line.
There is a bit more to it.

> Up at the top of his code, the lines:
>
> E equ 2 ; LCD Enable control line

You are correct. These modded programs really need to be commented.
I just set
R-W equ 1
RS equ 0
and Peter's code works.

BTW, why use a 10Mhz cystal. Does the counter have better actual
resolution?

Well, you are certainly a better program debugger than me!

Thanks again,

JJ

The point of view posted by "Orator for Decency" is not the FAQ for this newsgroup. It is in fact the deranged rantings of one Gareth Alun Evans, ex-G8DXY, G4SDW. He posts this "FAQ" approximately every week, apparently trolling for trouble (and frequently finding it!) Those that react to his FAQ are then subjected to systematic harassment.

If G4SDW learns of the employer of the individual who reacts, he makes a nuisance of himself there:
http://groups.google.com/group/uk.radio.amateur/msg/bc717f554a1c9469?dmode=source

If G4SDW finds that the individual who reacts has a hobby outside amateur radio, he makes a nuisance of himself in newsgroups relating to that hobby:
http://groups.google.com/group/uk.radio.amateur/msg/8443401f58f6cbbf?dmode=source

When he fails to get a reaction to the harassment described above, he will start making offensive posts using ludicrous anagrams of the individuals name:
http://groups.google.com/group/uk.radio.amateur/msg/7ff9b267900f1c9e?dmode=source

But amateur radio is not Gareth's only hobbyhorse. He frequently airs his unorthodox views on....

The Royal Family:

Ken,

You admit you have NO knowledge of present day ham usage of AM. And
apparently NO knowledge of old timey AM use. Properly designed, built and
used low level modulation works and sounds good.

I get glowing reports with my DX-60B, slightly modified to improve the bass
response. And a Bullet Astatic Mic.

And with the new rice boxes, if you adjust it right, you can get excellent audio out of them.

With the FCC reduction of power for AM full carrier, plate modulated (375watts) the big monsters are going the way of the Dinosaur.

Ignore this creep Andy.

It's people like yourself that are the lifeblood of amateur radio.

Good luck and see you on the air.

You'll find one in every crowd. He doesn't speak for me. Rebutting it only
adds to the noise level. Just add him to the kill file.

1029. Help finding suitABLE torroid core.

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-01-31 12:02:54 UTC

I'm wanting to build this active antenna, but can't find the core to
wind the output coupling transformer.

http://www.elecdesign.com/Articles/Index.cfm?AD=1&ArticleID=6244

This is the authors description of the transformer.

"The toroidal transformerï¿½s primary is 36 turns of No.24 enameled wire
wound on a core from a Sony 1-421-302 line choke. Its secondary is
nine turns of No.24 telephone wire."

And this is his decsription of the performance of the amplifier.

The frequency response at low gain is very flat (ï¿½0.2 dB) from 200 kHz
to 35 MHz, and is only 0.4 dB down at 60 MHz. At standard high gain,
the response is very flat to 25 MHz and -3 dB at 50 MHz. The maximum
output level in all gain configurations is over 500 mV rms into a
75ohm load.

Does anyone have any idea what type of core that would work as well?

Thanks
Mike

1030. Software-only USB driver for AVR

The following press release may be interesting to readers of this news group because it presents a complete solution for interfacing AVR mircrocontrollers to USB Hosts. In the minimum configuration the additional cost for USB is one resistor and a USB connector (if you choose the free Open Source software license). Sorry for the partially commercial content!

Die folgende Pressemitteilung koennte LeserInnen dieser Newsgroup interessieren: Sie stellt eine vollstaendige Loesung vor, mit der AVR Mikrocontroller an USB Hosts angeschlossen werden koennen. In der Minimalkonfiguration beschraenken sich die zusaetzlichen Kosten fuer USB auf einen Widerstand und einen USB-Stecker (bei Verwendung der Open Source Software Lizenz). Sorry fuer den teilweise kommerziellen Inhalt!

Subject: PR: Firmware-Only USB Driver for Atmel's AVR Microcontrollers

FOR IMMEDIATE RELEASE

Objective Development Announces Commercial Licenses and Bundled USB IDs for Their Free Firmware-Only USB Driver for Atmel's AVR Microcontrollers

Vienna, Austria - January 31, 2006 -- Objective Development today released a new version of their firmware-only USB driver for Atmel's AVR
microcontrollers (AVR-USB), just in time for the driver's one year anniversary. This version adds new licensing options and free USB Product IDs bundled with all license types, even with the free Open Source compliant license.

AVR-USB is targeted to small companies and hobbyists designing hardware with USB connectivity based on standard AVR microcontrollers. It implements a low speed USB device in the same way as a Software-UART implements asynchronous serial data transfer. The only hardware resources needed from the AVR microcontroller are two I/O pins, one of them must be an edge triggered interrupt.

Since RS232 ports have become rare in modern computers, USB is the method of choice for connecting various gadgets to the PC. The major drawback for small companies and hobbyists is the relatively large upfront investment which is usually required to work with USB: You need to buy a USB Vendor ID from usb.org (currently 1,500 USD) and maybe a new development system for USB capable microcontrollers. Furthermore, microcontrollers with USB are often available in SMD packages and large quantities only, making things even harder for small startup companies and hobbyists.

AVR-USB addresses all these issues. It comes with an Open Source
license, a USB Product ID which can be used for free (shared according
to the certain implementation rules), it is based on the free GNU
compiler as development environment and works with low cost AVR
microcontrollers which are available in DIP packages. The PC side
driver
can be constructed with libusb, a free USB abstraction library which is
available for Windows, Linux, Mac OS X and BSD Unix. No Microsoft SDK
or
development environment is required for Windows driver development.

Two affordable commercial license types are available for those who can
not agree to the publication requirement of the Open Source license.
The
entry level license for 199 EUR allows using AVR-USB in up to 150 units
and comes with a dedicated USB Product ID for exclusive use. The
professional license for 500 EUR has virtually no limit in the number
of
units (fair use) and comes with two dedicated USB Product IDs.

AVR-USB can be downloaded as part of an example application at the URL

http://www.obdev.at/products/avrusb/powerswitch.html

For more information about AVR-USB see

http://www.obdev.at/avrusb/

About Objective Development

Objective Development is a creative team of experienced software
engineers, specialized in developing innovative, intelligent computing
solutions. The brand "Objective Development" represents high quality
niche products for private and commercial users, filling the gaps
between large standard applications.

The company's product line includes "LaunchBar" (an award winning
search
utility and recent winner of the Macworld 2005 Editors' Choice Awards),
"Little Snitch" (an application based reverse firewall), "WebYep" (a
web
content management system) and Sharity (an SMB file system for Unix).

==========

Assuming the freq range intended is 1 - 30 MHz an Iron powder core made of
Mix No 2 material (permeability 10) ,colour code : RED , would be suitable.

Size T50 has outer diameter 0.5 inch and inner diameter 0.30 inch
hence T50-2
Size T68 has outer diameter 0.69 inch and inner diameter 0.37 inch
hence T68-2
Size T80 has outer diameter 0.795 inch and inner diameter 0.495 inch hence
T80-2

If the frequency range is to be from 0.02 - 30 MHz the above type of Iron
core can be combined with a same size core of Mix no 3 material ,colour
code : GREY eg the 2 types of ring glued together and wound together.

There is also a ferrite type core which covers the frequency range
0.02 -30MHz made from Mix No 61 material (permeability 125) ;colour code
: GREY ; designations FT50-61 ; FT68-61 ; FT80-61.

It sounds like a conventional broadband transformer. The ARRL Handbook
has some guidelines on how to design the things, it's quite simple, if
you select a suitable ferrite core.

With that turns ratio, I would use a smaller wire for the primary,
probably No. 30 silver plates Kynar insulated wire wrap wire.

> And this is his decsription of the performance of the amplifier.

> Does anyone have any idea what type of core that would work as well?

I would try a core ordinarily used as a medium frequency noise
suppression core, with enough window area to allow non overlapped
turns around the hole. Perhaps a Steward 28B0870-000, 22mm OD, 13.7mm
ID, 6.4mm thick. This is made of 850u material, flat permeability out
to about 2 MHz, and then rolling off with increasing loss as frequency
rises.
http://www.steward.com/web_part_no.asp?line=EMC%20/%20EMI%20Board%20Level%20and%20Cable%20
Core%20Products&family=Ferrite%20Cores%20for%20Cables%20-%20%20Wiring%20Harnesses%20-%20Co
nnectors&product=Broadband%20Solid%20Ferrite%20Cores%20for%20Round%20Cables%20and%20Wiring
%20Harnesses&progroup=1.%20Round%20and%20Cylindrical%20Cores&part=28B0870-000
There is also one twice as thick, if you want to lower the turns count
a bit. 28B0870-100.

But if the goal is to have optimum response at the low frequency end,
and to absorb the higher frequency end, a core made of the 5000u
material would be even better. Type 35 (Steward's low frequency bead
material) has flat permeability to only 300kHz. A usable example
might be LFB220140-000, 22mm OD, 14mm ID, 12.7mm thick.
http://www.steward.com/web_part_no.asp?line=EMC%20/%20EMI%20Board%20Level%20and%20Cable%20
Core%20Products&family=Ferrite%20Cores%20for%20Cables%20-%20%20Wiring%20Harnesses%20-%20Co

nnectors&product=Low%20Frequency%20Ferrite%20Cores&progroup=1.%20Round%20and%20Cylindrical%20Cores&part=LFB220140-000
This one could probably work with fewer turns, but the same ratio.

These cores go for less than a dollar each from Digikey.

The material curves are in the toroid manual:
http://www.steward.com/pdfs/ToroidCatalog-rev11-C.pdf

It is no wonder wherever he goes he is loathed, I wonder if his wife knows that he condones the murders of children, and police officers etc. The "Orator For Decency" would not know the meaning of decency, he appears to be a bitter, evil, and twisted little 'man' , if it were not for visits from the police I doubt if he would have any visitors. His inferiority complex must give him sleepless nights.

I disagree with this advice. It would be appropriate for a narrowband, tuned transformer, but that's not what the schematic indicates. It's a broadband transformer which has different requirements for a core. What you need is high winding impedance, not the high Q and relatively low impedance provided by the cores Frank is recommending. An appropriate core is a "low frequency" ferrite such as Fair-Rite (and Amidon) type 70-series (72, 73, 77, etc), or type 43 which is very widely used for EMI filtering applications. You can easily identify "low frequency" ferrites because they're the only ones which give you any continuity (although the R might be high) when probed at two points with an ohmmeter. Type 43 can't be identified this way -- they'll show an open circuit. As for core size, the number of turns specified on the diagram will provide enough impedance with any core of size half inch diameter or so, or larger, and with normal geometry. You could probably get by with a core smaller than that if necessary.

High frequeny ferrites (which aren't suitable) like 61 are relatively rare, so if you have any ferrite cores in your junk box, they're likely to be ok. Powdered iron cores won't give you enough winding impedance.

Those are type 43 ferrite (Fair-Rite designation), the most common kind. Your cores will be just fine for this and similar applications.

You're definitely not the only one confused about core types. Very few people seem to understand what the requirements are for cores used in various applications and therefore what cores are suitable for a given application.

Only if you tell us your board stackup dimensions.

Various freeware programs such as TxLine
(http://www.taconic-add.com/en--downloads.php) can compute these dimensions
for you quite easily.

1043. WWV receiver, CHU proposal...http://cbc.am/CHU.htm

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-01 05:24:46 UTC
From: Max Power <mikehack@u.washington.edu>
Message-ID: <drph11$1me$1@gnus01.u.washington.edu>
Source record: 13944
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.homebrew,sci.electronics.design

CHU Time Station : Western Canada Coverage Proposal

The CHU time station is Canada's domestic shortwave time signal station.
CHU existed long before the Internet and sattilite navigation systems like
(GPS, GLONASS, Gallaeo).
CHU provides most of the functionality of the US WWV & WWVB (Bolder,
Colorado) and WWVH (Kauai, Hawaii).

Problems with CHU's configuation that this proposal addresses

The 3.3�s per km of path that makes CHU's signals problamatic for users in
Western Canada. Even the NRC realizes this: "for all distant users of CHU,
the dominant source of time error comes from the radio wave path reflecting
off the ionosphere as the radio signal travels from the transmitter".
The poor quality of CHU reception in Western Canada and the Artic, North of
55� Latitude.
It is suggested that the 7335 kHz frequecny be reused, but it may be
advisable to find alternate frequences.
The CHU signal fomat may need to be tweaked so as to take into consideration
2 transmitter sites.
A new set of atomic clocks will be needed, as well as equipement to sync
them to NRC's atomic clocks. It may be possible to obtain secondhand atomic
clocks from UBC (Vancouver) or other universities in Western Canada.
This proposal could be replicated in Newfoundland using another existing CHU
frequency, as Eastern Canada has CHU coverage problems as well.
Universally upgrading CHU's Ottawa transmitters to 10 kw may not fix CHU
coverage problems in Western or Eastern Canada.
[...]

Since I'm going to have to order a chip for that Astron PS I was working on, I dug out another old PS that died a few years back. If I have to pay shipping, I might as well order enough parts to at least make up for the shipping costs...

Does any of you guys know where to find a schematic for a Yaesu FP-757HD power supply? It has a 3-terminal regulator in it, it looks like a 317, but it has funky markings on it which say B824, then down and to the right it says Q5D. It might be an O or 0 (zero) 5D. Do you guys know if you can replace this B824 thing with an LM317? The transistors are oddballs too but I haven't gotten the number for them. If I have to, I can just start from scratch on it, there's not much to it and there were a couple of caps with the legs corroded off. I can probably just come up with my own regulator as easy as I can fix this one unless I can find a schematic.

Do you guys know where to find a schematic for this thing?

Tnx,
Kerry, WD5ABC

you HAVE to use a crystal oscillator. due to the nature of the tuned
resonant circuits, mistuning can change the propagation delay of the
signal through the receiver by incredible amounts. soooo, you have to
be on frequency. i think I still have some where a schematic of such a
receiver from Popular Elactronics but it may take a while for me to
find it.

When dealing with Yaesu (Vertex) it is worth the effort to contact
Vertex for special parts. There is a special regulator in the power
supply for the FT-301 that is no longer available. Contacting Vertex
led to a replacement subassembly for about $6. Not bad support for a
25 year old piece of equipment.

japanese transistors are usually marked without the two first markings...
For instance a 2sb824 will be marked as b824.
Fets are marked as 2sk or 3sk.
Diodes as 1s..., it is like the american notation 1n, diode, 2n transistor
etc....

Not so, Saandy. He said STRIPLINE, not microstrip. Now he may not know the difference, but that is an incorrect value for stripline.

WHich is it, microstrip (open face) or stripline (sandwich)?

Jim

1058. New program - Antenna Counterpoise

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-02 02:06:08 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <drrpefpun1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 13856

A coil-loaded counterpoise at a low height above ground is used to provide an artificial ground for an antenna when, for some reason, a true ground connection is not possible or there is not enough space to erect a full 1/4-wavelength horizontal wire.

The principal effects of low height are a loss resistance induced in the wire from the ground, and a reduction in propagation velocity along the wire.

A counterpoise can be considered to be an artificial ground. Its input resistance at resonance is equivalent to the input resistance of a true ground connection but its resistance will never be as low as a good ground.

To provide a lower input resistance three or four counterpoises can be used in parallel. Or they can be resonant on different bands.

New program C_POISE estimates the performance of a single coil-loaded counterpoise. The number of turns on a coil of given length and diameter needed to resonate a low wire to 1/4-wave resonance is calculated. The input resistance at resonance is also estimated..

All program output data is approximate due to the very low height of the wire above ground and uncertainty in the characteristics of the soil or whatever other materials may be under the wire. The wire may be allowed to rest on the ground surface but uncertainty will be at a maximum. It will nearly always be needed to prune the wire length for resonance. Or when the wire length is fixed the coil turns may need adjustment.

When wire height exceeds wire length accuracy is much improved. Input resistance at resonance will be fairly small. Working Q will be high and the counterpoise will behave as a short antenna. For precise resonance the wire will still need pruning.

Download program C_POISE in a few seconds from website below and run immediately.

Here we go:

3 - Pass (NPN) transistors Q1 - Q3: 2SD717-Y
on heat sink

These 3 should be on PC board (AVR Unit PB-2156
Q101 - 2SK192-BL (looks like FET)
Q102 - 2SA1012Y (looks like PNP bipolar)
Q103 - 2SA950Y (looks like PNP bipolar)

Q102 drives the pass transistors
Q103 Base connected to VR101 for adjustment (voltage adjust?)

Perfect, I got the schematic, thanks! Looks like there's not too much

to it. I picked up a few parts in San Antonio today for the Astron (I thought it was fixed, but it's still not right). I'll have to think about the Yaesu and see if I can find some of those parts or at least find what they cross to.

Thanks for all your help!
Kerry

The one I'm looking at with that strange part number is a TO-220. I'll
have to take the schematic and see which one it is, that number doesn't
match any of the part numbers on the schematic. I picked up a few spare
723s and 317s today, maybe I'll just make my own if I have to.

73,
Kerry
PS That's a great web site, I just bookmarked it.

i have a schematic for the YaesuFP757HD power supply.
in the schematic there are no regulators, there are no IC's, just 5
bipolar transistors and a fet.
this is providing that they didn't update the circuit and you have a
newer one than me.
if you email me your address i will photocopy the schematic and post
it to you.

Or download "AppCad" free from Hewlett Packard. It does both microstrip and
stripline and as they say on Madison Avenue, "So much more".

No. Microstrip is the transmission line on one side of a double-sided PCB
and the ground plane on the other side. Stripline is with TWO PCBs with the
transmission line sandwiched on one of the boards and ground planes on BOTH
the outside layers. It makes for a much improved shielding at the expense
of much more complex mechanical assembly.

Oh, well, those of us who deal with multilayer boards regularly use stripline: lines sandwiched between ground planes on inner layers. But from the sounds of it, Wim almost certainly is using microstrip. However, if you look more carefully at it, you'll discover that your 75 ohm line is NOT 75 ohms "from DC to daylight" -- things fall apart at low frequencies (significantly so below 1MHz or so), and where the dimensions of the line are comparable to a wavelength (well below "daylight"). But again, Wim should be fine using the dimensions you originally gave him for what he wants to do.

Cheers,
Tom

It's a long and twisty path...

When Hewlett-Packard split off the test and measurement, life sciences, medical and semiconductor businesses in 2000 as Agilent Technologies, AppCAD went to Agilent. But last year, Agilent split off the Semiconductor Products Group, which is now a new company, Avago Technologies. Because AppCAD supports design of circuits using the semiconductors, it went to the new company. If you go to http://www.avagotech.com/ and search for appcad, you will pretty much immediately find a link to the Avago-supported version. (You can also get there by searching for appcad on the Agilent home page, but it will redirect you to Avago.)

Shortwave? Of course, it won't be 24/7.
I'm sure there may be other choices (VOA, others), but AFRTS first came
to mind here:

The shortwave frequencies:

http://myafn.dodmedia.osd.mil/radio/shortwave/

The schedule:

http://myafn.dodmedia.osd.mil/radio/afn/schedule.asp

I fondly remember the days I listened to AFRTS -- medium and short wave
-- while stationed at Ramstein AB in (West) Germany (on a BC-348.)

>
>I am in Rochester, NY.

There should be no real problem in receiving WWV in NY state unless
you want to do it with a few feet of hook-up wire dangling inside
the room. For just WWV on HF, use whatever is handy for a long-
wire OUTSIDE...some #26 or #28 coil wire would work and be near-
invisible on the outside.

The sensitivity needed by your receiver depends ENTIRELY on how
much signal arrives in your area and how much of that the antenna
intercepts.

>> *HOWEVER*, 10 has one huge advantage -- there are very low cost uP crystals
>> for 10 MHz, so building even a simple reciever with a brick wall front end
>> isn't such a big deal, if the only frequency you care about is 10 MHz.

>Yes, that is what I was thinking. Is there a simple way to do frequency
>multiplication (or division) to get 2.5, 5, 15, and 20 MHz additionally,
>and thus be able to switch between all of the WWV frequencies?

To make a simple superheterodyne receiver, even if just single-
conversion using a legacy 455 KHz IF, capitalize on some simple
tuning arrangements using an RF Amp, Mixer, 1 or 2 stages of IF:

1. A single set of front-end inductors, tune RF and LO with Cap.

2. Capacitor tuning using fixed+trimmers. Frequency range of
5, 10, 15 MHz selected by rotary switch has a total frequency
range of 3:1 high to low. The capacitance change ratio for
this is the square of the frequency change ratio or 9:1.

Note: In the old "communications receiver" designs, it was
typical to cover a 3:1 frequency change ratio with a "365 pFd"
variable capacitor (typically 40 to 360 pFd min. to max.).

3. If there are temperature-drift problems in the LO, just make
use of a small front-panel control to a parallel trimmer cap
on the LO tuning (added to the cap. of the LO resonant ckts).

4. In most cases, the temperature drift is negligible and one
can make do with behind-the-front-panel trimmer cap. settings

for three switch-selected frequencies. Some simple experiments
with an oven termometer and a frequency counter would let you
check out the drift versus temperature and compensate. Begin
with mostly NPO caps fixed for the LO tuning, expect a towards-
low-frequency drift, compensate with negative-temp coefficient
fixed capacitors for the NPOs. Temperature drift is highly
dependent on WHAT you build and HOW you build it.

>"Brick wall front end"?

No need. WWV time-frequency service frequency allocations have a
protected 10 KHz bandwidth, protected from other modes in other
radio services. Given a typical Q of about 40 and two tuned
stages (ant to RF amp, RF amp to Mixer), the bandwidth would be
about 80 KHz (5 MHz) to 250 KHz (15 MHz) in the front-end. With
an IF of 455 KHz, the image frequency would be 910 KHz away.

WWV is AM, not SSB, and most probably will be used to zero-beat
external CW frequency sources that are going to be calibrated.

For those who want "extreme accuracy" in time, just compare the
time-ticks to a 1 Hz (divided down from standard to be checked)
local tick. That was the way things were done with the old
General Radio primary standards equipment circa 1950-1960, good
to 1 part per million accuracy without sweat.

>
>That sounds great.

If all that is wanted is SIMPLICITY, just use any old SW BC or
wide-tuning-range HF receiver. [suggested by another]

You can convert an old "All-American-Five" AM BC receiver to
receive 5 to 15 MHz just by substituting the "coils" (inductors
is the proper word now). Substitute an inductor for the old
loop or loopstick...with a primary link for an external antenna.
[I did this many, many years ago...it works] It won't be "top
of the line" in performance, but then a regen isn't that either.
The IF can be aligned easily and the new front-end alignment
is fairly easy.

The old Hallicrafters S-38 four-band "starter" receiver that
many used was really a simple "All-American-Five" Mixer-Single IF-
AM detector-Audio Output arrangement with an added BFO. A BFO
isn't needed to beat a local frequency standard with WWV.

Assuming an original 45 pFd, 101 pFd, 405 pFd capacitance (which
includes the stray circuit capacity) to tune 15, 10, 5 MHz, a

2.5 uHy inductance will do the job. A trimmable inductor would
be best there. The first task is to check the inductor
substitutions with the existing variable capacitor. If that works,
the variable can be substituted by a switched trimmable capacitor
to avoid the knob-twisting for three HF selections...or two, or
none at all assuming fixed tuning to 10 MHz.

An old tube AM BC receiver relegated to the basement/garage
junkpile is a good candidate for this kind of thing. Tube type
radios are a bit easier to work with if you aren't acquainted
with newer solid-state circuitry. Those are certainly cheap. :-)

A converted "All-American-Five" will NOT have great sensitivity.
But, since tubes' stage gains are essentially transconductance x
load impedance, the individual gain stages can be optimized by
going for minimum-C in resonant circuits. Not that easy with
old transistor radios having individual transistor stages...those
needing fussing about with matching input-output impedances.

>> A friend of mine did an article on a simple WWV reciever for QRP Homebrewer
>> recently, issue #5 I think. He was more interested in the frequency
>> standard than hearing the sounds, so his contribution was recognizing the

>
>I don't see any articles on WWV receivers there... Does anything look
>familiar: http://www.njqrp.org/data/qrp_homebrewer.html

Depends on WHAT EXACTLY you are striving for and your own
experience-knowledge. If you are a relative beginner (we all
were once), then I'd suggest converting an old tube type BC
receiver. That avoids the construction hassle and concentrates
on individual theory areas during conversion. It's the least
expensive route if using an old BC junker receiver. Individual-
area concentration can teach more about those areas than building
a pre-designed kit or magazine article project.

Well I have to agree with the other poster who also owned a novice rig
with a grid modulator and nobody could hear him. I had the same
experience. The DX-60B may have had a well designed modulator and you
have it adjusted just right. (also you are not trying to over drive
the final). A plate modulator for a low power rig would make sense
if you really want to operate AM and put out a good signal.
I remember in some old ARRL handbooks there were some mobile am rigs
that used a filament transformer as a modulation transformer with a
pair of DS501 transistors (from old car radios) in the modulator.

A hint on rewinding transformers. When you disassemble a power transformer
you will note that the laminations alternate (IE: open end of even numbered "E"s
point left, odd numbered ones right). If you took apart a filter choke you
would find that ALL the laminations were oriented the same way. For an
audio transformer, arrange the laminations in groups, and alternate the
groups. Divide the total laminations into 3-10 groups.

Why? In the case of the choke, which must carry DC, we don't want the magnetic flux to saturate or the inductance will start to drop at some current. Having all the laminations go in one way leaves a nice air gap in the core which prevents core saturation. In the case of a power transformer which carries only AC we want the magnetic flux to be tight to keep efficiency up. For an audio transformer which must carry some dc (tube plate current), and ac (audio), a mix of these works out best. Note that in the case of a push pull primary (modulation or output transformer) the balanced dc current cancels out and we don't get much saturation of the core. A single ended output transformer WILL have this problem, as will the secondary winding of the modulation transformer.

A swinging filter choke should have some core saturation, probably it uses two or three groups of laminations.

poise(s)
> of any length in series with an adjustable series resonance circuit
> ,adjusted for maximum RF current at the operating frequency ?

> Frank GM0CSZ / KN6WH
==========

Frank, the effectiveness of a counterpoise depends on its input resistance. The lower this resistance better it is. It is the 'ground' connection for the antenna. (And the transmitter).

But there's no point in making it longer than 1/4-wave. This increases coupling with the ground, increases loss resistance and also undesirably increases radiation resistance. The counterpoise then behaves more like a very low antenna.

When it is 1/2-wavelength long it has a very high input resistance and is entirely non-effective. It may just as well not be there.

At some lengths the loading coil would have to be replaced with a loading capacitor.

Remember, the antenna wire plus counterpoise is behaving as an off-centre fed, bent, dipole with the lower section being very near to the lossy ground. (Whatever the ground is). We don't want the lower section to be TOO long. The current into the counterpoise is the same current as is entering the antenna. If there is an antenna tuning unit it will tune up the counterpoise simultaneously with the antenna. They behave together as one thing!

So there is no point in having a separate tuner just for the counterpoise. Maximum current flows into the counterpoise at the same time as it flows into the antenna proper.

The purpose of the loading coil in the counterpoise is to provide a low impedance connection to the braid of the coaxial feedline. If there is no feedline then it provides an artificial 'ground' for the transmitter plus tuner.

And all the foregoing arises because it is difficult or impossible for the station owner to provide a set of buried ground radials.

Reg, G4FGQ

Hi Trevor

Well, I was surprised by the animosity. If I were to regularly meet that within on air conversations I would be quite bothered I think. I remembered the hobby as being very gentlemanly and was therefore qute suprised. I think I may just lurk about an some of the HF / VHF bands and see what actually happens before deciding to get my iron out again.

I'm seeing my old mate G4GCO tonight for a few beers, no doubt we will discuss this as well.

Thanks for the comments

Thanks to everyone who commented

It seems that maybe this is not the general view of class B after all.
I'm going to lurk about on HF/VHF for a while listening and see how it
goes down, maybe I'll get my iron out then and do some stuff.

Thanks for the advice all

Andy G8LIR

>From what you write below, you would seem to qualify as
a _REAL_ Radio Ham, the essence of Radio Hammery,
and pursuing activities that the FAQ praises.

To get as far as the bit you quote below, you must have
read the opening paragraphs which speak in support of
the style of Radio Hammery which you say is you, and so
it is difficult to understand why you should seem to take offence
at remarks which clearly are not directed at you. As you say below,
you have been "out of it" for a number of years, so it is unlikely
that you were aware of the gangrenous degeneration that is
the M3/CB Fools' Licence scheme or that you availed yourself
of the facility.

The groups which are criticised by the FAQ are those who
have featured in this NG in the years gone by, and any
animosity has, indeed, been originated by the criticised groups.
For me, Radio Hammery has always had traditions of international
gentlemanliness and these criticised groups do not have those
traditions.

So, you would appear to come from the traditional seed-corn of
Radio Hammery, where it is a technical pursuit with jealously
guarded privileges and yet you seem to take offence at criticsm
of those who are not in your league.

I offer no apologies for maintaining a stance to uphold the
technical and gentlemanly traditions of Ham Radio; nor do
I apologise for setting ourselves apart from CBers.

There is no animosity expressed by urging those of a technical
bent to join us; neither is there any animosity in standing apart
from those who are not our fellows by any stretch of the
imagination.

Where there has been animosity, it has been on the part of those
who make up the groups criticised.

The personal and insulting remarks below are very much those
that are typical of CBers - Childish Broadcasters - the very
people whom the FAQ criticises. Such remarks do not
fit in the gentlemanly traditions of _REAL_ Ham Radio.

I am not familiar with the Yankland licensing schemes.

Is "W5EGO" perhaps some for of CB licence - the abusive
personal style quoted below would seem to suggest so.

There is no attempt to demean anybody by a taxonomy of those
who are _REAL_ Radio Hams and those who are CBers of one
sort or another.

There is no troll in expressing a serious concern about what
is happening in Radio Hammery and in seeking that the
technical and gentlemanly traditions be maintained.

If you think it is a troll, then perhaps you are one
of the CBers-Masquerading-As-A-Radio-Ham that
the FAQ warns against?

You are the very model of a newsgroup personality.
You intersperse stupidity with tedious banality.
Psudonyms you've plenty of; both genuine and ghosted, too,
On all the countless newsgroups that your drivel is cross-posted to.
Our bandwidth you will fritter with your whining and your snivelling,
And we're the ones who pay the bills, downloading all your drivelling.
Your enemies are numerous, and no-one would be blaming us
For cracking your head open after you've been rudely flaming us.
You hate to lose an argument (by now you should be used to it).
You wouldn't know a valid point if you were introduced to it.
Your learning is extensive but consists of mindless trivia,
Designed to fan your ego, which is larger than Bolivia.
The comments that you vomit forth, disguised as jest and drollery,
Are really just an exercise in unremitting trollery.
You say you're frank and forthright, but that's merely lies and vanity,

The gibberings of one who's on the limits of his sanity.

With apologies to Gilbert and Sullivan :-)

It's even more impressive if you sing it to the tune of "Modern Major
General" -- the penultimate line has to be forced to scan, but the rest
flows nicely.

There now appears to be a chorus of rather silly
and childish individuals who are taking delight in the
abusive remarks put about by each other.

Such Childish Behaviour (CB) does nothing for
the public's perception of Radio Hammery, and,
indeed, may well serve to dismay those who
are potential candidates to become _REAL_
Radio Hams.

Shame on all those who exhibit such infantile glee.

Superb Mike... I didn't know you had such music talent!

I reckon we could sell a few copies at various rallies if it were put
to music :-)

Any suggestions for a suitable title?

Peter, G3PHO

We are the very model of the modern radio amateur
We like to speak to countries strange while sitting in our arm-a-chair,
Our QSOs with digimodes and microphone are hard earned
(Of course we don't use rubbish like that old morse code we haven't
learned).

We have a whizzy handheld 'coz it makes us look much neater -
Of course we don't use it to talk, just key up the repeater
Except of course when 'breakers' from two streets away give us a shout,
Then we tie it up for hours, forgetting 'bout the time out.

(Then we tie it up for hours, fogetting 'bout the time out.)

We don't know what a dipole is so can't get ourselves on the air
But Echolink and E-QueSo means that we really couldn't care
With every cheaper foreign calls you'd wonder why we bother -
The answer to that mystery still hasn't been discovered.

I think this could be better - but it's Friday night, so time for even me to
go and get a life!

We'd need a few more tracks. Maybe:
"You gotta troll with it" by Oasis
"Rant music" by Adam and The Ants
"You won't work another fool M3" by The New Seekers
"I gotta brand new M3 licence" by Melanie
"Milk and methylated spirit" by Dr Feelgood
"Meths in the jar" by Thin Lizzy
"I go to sheep" by The Pretenders
"R.S.C.B" by The Village People

Tobin-

A couple other ideas:

1. Try your hand at building a crystal set! Just an antenna, a tuned circuit, a diode and earphones. There could be more sophistication such as using an amplified speaker and higher-Q tuned circuits.

2. Try a direct-conversion receiver. It may be just a more sophisticated crystal set with RF preamplifier and on-frequency crystal filter. A product detector could be included to convert to audio, but a diode detector should work and wouldn't change the audio tone frequencies.

I considered using this direct-conversion approach to obtain an accurate 10 MHz signal. I wanted to use it to synchronize my oscilloscope so I could adjust a counter's timebase (or vice-versa). However, I never built it after finding a Rubidium controlled oscillator on eBay.

1125. Cushman CE50 help needed

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-04 03:40:25 UTC
From: RoDnSuE <sad.tip@verizon.net>
Message-ID: <1139024425.435393.181360@g44g2000cwa.googlegroups.com>
Source record: 13775

Hi,
I have a slightly sick Cushman CE50-TG-1 service monitor and was
wondering if anyone has taken any voltage readings from a working unit
they would be willing to share.
I need to check the voltages at test points 3 & 4 on the 29000 board
with the frequency set between 9.9999mhz and 100khz. That should give
me the normal range for both the A & B VCO's control voltage's.
(referenced to chassis ground) Any other voltages would be helpful so I
can note them for future reference.
Sure would have been nice if Cushman would have provided some basic
voltage readings on the schematics.

Any help would be appreciated,
Thanks,
RoD

So did I.

You are the very model of a newsgroup personality.
You intersperse stupidity with tedious banality.
Psudonyms you've plenty of; both genuine and ghosted, too,
On all the countless newsgroups that your drivel is cross-posted to.
Our bandwidth you will fritter with your whining and your snivelling,
And we're the ones who pay the bills, downloading all your drivelling.
Your enemies are numerous, and no-one would be blaming us
For cracking your head open after you've been rudely flaming us.
You hate to lose an argument (by now you should be used to it).
You wouldn't know a valid point if you were introduced to it.
Your learning is extensive but consists of mindless trivia,
Designed to fan your ego, which is larger than Bolivia.
The comments that you vomit forth, disguised as jest and drollery,
Are really just an exercise in unremitting trollery.
You say you're frank and forthright, but that's merely lies and vanity,

The gibberings of a loonie on the limits of his sanity.

With apologies to Gilbert and Sullivan :-)

Indeed, in consideration that the FAQ is maintaining a
stance for the traditions of _REAL_ Ham Radio, the
traditions of technical motivation and gentlemanly
conduct, against the influx of the Mongolian Hordes
of CBers of one sort or another, it would be reasonable
to assume that the chorus of abusive and infantile
objectors are all from the CB camp, and therefore
providing graphic illustration of why it is necessary to
take this stance now.

It would seem that the CBer-Masquerading-As-A-Radio-Ham
is no recent phenomena - there are some hoilding licences
issued in the G4K-- series.

Irrespective of when such licences were issued, public
outbursts of Childish Behaviour (CB) do the cause of
Radio Hammery no good at all.

Look who's talking, or should that be stalking?

Come to think of it, you would make a fine dung beetle, rolling along a
huge ball a crap, the crap being your over inflated opinion of yourself.

You could make up a simple crystal tester and find out their
parameters. The same techniques should work OK.

Has this chappy got as far as upgrading the so-called 'faq' (which might be frequent but has little else to recommend it) to include the warning that 'repairing with gusto' only applies to transistorised PAs with low power output and not compact valve PAs with 600V on the anodes?

If not, why did he introduce that caveat elsewhere?

Still, let us not forget this was the same chappy who sold an FT-101 because the tune-up pages were missing from the manual.

Are there any other snippets about Mrs.Nugatory?

The only things I know about her is her habit of cowering
behind twitching curtains, her watching of the film, "The
Bitches of Toko-Roko", and being able to prove in
20-page obsessive (and irrelevant) dissertations that I
know nothing about certain topics based purely on my
use of a comma in place of a semi-colon.

"Simple," "SDR," and "DSP" do not belong together in the same sentence. Anything you do with that kind of hardware is going to be inherently complex. Be prepared to write a lot of code.

Good luck.

I know that there are several plans on the internet for building a radio controlled clock. These involve building a fixed frequency rx and then hooking it up to a clock. How feasible would it be to hook the same circuit up to an amp and speaker instead of a clock? I suspect that the clock radios listen in on 60khz, but it should be simple to insert a crystal or change it to get 10Mhz. Also, you could build a radio with three frequencies-5Mhz, 10Mhz, and 15Mhz in order to take advantage of day vs night propagation.

I haven't looked at any of these circuits, but I'd expect it to be
quire easy to connect and audio amplifier and speaker to the output of
the detector.

>
Converting a 60 KHz receiver to 10 MHz is likely impossible -
construction techniques and tuned circuits will be quite different -
you can almost use audio techniques and iron-core coils at 60 KHz, but
are well into RF territory at 10 MHz, and will likely have to use
air-core coils in the tuned circuits.

Not just that. The transmitted code is also different.

Huh? Yes, he is well into RF and construction techniques will be different.
But while there are advantages to air-coil cores, their use in recievers
went out with hollow state detectors. Even in transmitters they tend to be
only used in the KW neighborhood anymore. I can't imagine that even in the
wilds of BC people are winding air coils and building on heavy steel
chassis.

Almost by definition the hardware is simple. And experimentation in
software is a lot easier and less painful than hardware experimentation.
But you are correct that there will probably be quite a bit of code,
although not all of it needs to be written from scratch.

If you graze the Microchip dsPIC forum, a British ham talked about such a
project a few months ago, sorry I can't recall his name. I think he may
have posted some stuff on the PIClist, too. He did use some sort of codec,
along with the dsPIC. I picked up the codec and dsPIC with the intent to go
down that path, but those round tuit thingies are hard to come by around
here.

No, its not. It was never intended to be listened to. It has a 1 BPS
data rate encoded time signal that has always been used to carry time
code.

From: Bill Powell <whp@att.net>
Message-ID: <igocu15bhga5v72k09atrpbbkjbd3qp0or@4ax.com>
Source record: 13816

I'm seeking information about using 2 or more closely spaced SM
inductors (unshielded - not torid or shielded) in a bandpass circuit.

The application I'm thinking of would use two closely spaced SM
inductors and varicaps to tune both the center frequency and bandpass
and allow simple and repeatable construction without the need to
locate and wind torids or find specialty inductors.

Please - experiences and not pure speculation.

Thanks,
Bill - WB1GOT

1166. Re: SM Inductors As BP Circuit

Source record: 13817

The FAR circuits 9850 VFO board uses SM parts for the filter - elliptical
not bandpass, but it seems to work fairly well. The inductors aren't right
against each other, but they are pretty close and in the same orientation
(not my idea of a good plan). There is a picture of the arrangement at
http://www.qsl.net/wb8rcr/AD9850.html

I have gotten 80 dB rejection from 80 MHz to 500 MHz (the limit of the
network analyzer) in a 23 MHz 7th order butterworth filter I built
using 4 surface mount inductors in a 20 mm line. I would give it a try.

Yes, it can be done. Murata especially has a family of wire wound coils
size 1002 , unshielded, which are quite good at that. i designed
bandpass filters around 434 MHz with losses of about 1dB per dual
sections filters. point is that you can't calculate the coupling with
areasonable degree of accuracy, so you have to experiment with it. But,
once found, they are very repeatable. in this design the inductors were
22nH.
the long axes of the inductors are supposed to be parallel, since you
are interested in the magnetic coupling between them.

Experience with filters here indicates that EVERY filter design
BEGINS with speculation. :-)

Bandpass filters can be designed for specific bandpass without
using inductive coupling. Those with percentage bandwidths
less than 5% can be tuned around the bandcenter without much
change in bandwidth. What bandcenter and bandwidth were you
considering?

From a scan of several different manufacturers of SMD inductors,
they don't specify any coupling so it would be experiment time
to find it out as one has already observed in here. I've found
that trying to determine coefficient of coupling by experiment
is more difficult than designing and tweaking a non-coupling
filter. Mileage varies.

If you want a small program that does passive (non-inductive
coupling) L-C filters (low, high, band, reject) synthesis and
analysis (with ability to set individual component values and
simulate Q), ask me in e-mail for LCie4. Ain't flashy but it
works. Freeware.

Small-quantity toroid forms are available at reasonable prices
quickly from www.kitsandparts.com. For home use, I like Neil
Hecht's (www.aade.com) little L-C Meter for much-easier
zeroing-in on inductance values when winding toroids along
with checking out fixed, small-value capacitors.

Actually, right on cue, Mrs.Nugatory has continued with
her stalking of me, with another sock puppet that provides
a graphic illustration of the critique below!

Go to uk.rec.models.engineering, and google for
author, "Novae Artes"; the modus operandi is
unmistakeable!

She demonstrates so well her neurotic obsession coupled
with her desperate need to make insulting remarks in a
long and vitriolic diatribe that once again, seizes on some
trivial and irrelevant point. (The Yanks almost certainly will
not have heard of Araldite)

Not only that, but by having to go to the web to find some
material to quote from somebody else, she demonstrates so
well that not only does she know nothing about the simple
mechanical and electrical properties of tuning condensers,
she knows nothing about anything and is incapable of
enjoining discussion off the top of her head. It is no
wonder that in an interest that is calimed to have lasted
for 50 years, she has not achieved any licence, not even
an M3/CB Fools' Licence promoted by the gangrenous
degeneration that is the RSCB council and all its members.

What a silly, silly girl is she!

The Psychiatrists report:

When the orator for decency aka Gareth Evans is challenged, criticised, or just ridiculed,
He refers to the other person(s) as she.

So it seems in order to denigrate them he changes their gender to female in his postings.

This is extremely interesting, and points to a hatred of females, followed by their subjugation by him.
It could also be coupled to a deep loathing of his mother who possibly failed him some way in his eyes.

Such problems are not uncommon in males who have a problem with normal life.
Also it is quite common in sexually dysfunctional subjects.

I would warn females not to approach an individual with such a profile

His wife has a lot to endure with the obsessive nature of her husband, and we should feel sorry for her.

This is a case that we will have to study more closely.

The Psychiatrists report:

When the orator for decency aka Gareth Evans is challenged, criticised,
or just ridiculed,
He refers to the other person(s) as she.

So it seems in order to denigrate them he changes their gender to
female in his postings.

This is extremely interesting, and points to a hatred of females,
followed by their subjugation by him.
It could also be coupled to a deep loathing of his mother who possibly
failed him some way in his eyes.

Such problems are not uncommon in males who have a problem with normal
life.
Also it is quite common in sexually dysfunctional subjects.

I would warn females not to approach an individual with such a profile

His wife has a lot to endure with the obsessive nature of her husband,
and we should feel sorry for her.

This is a case that we will have to study more closely.

hmmm ... I had lept to the conclusion that OP was concerned about undesired coupling, rather than desired coupling.

I think SMD inductors are typically designed so as to not maximize their susceptibility to objects in their vicinity, although not necessarily minimize it.

Another issue of concern is self-resonance. Some SMD inductors have rather surprisingly low self-resonant frequencies. Obviously, some designed for cell phone service typically won't, but it is yet another parameter to fret over.

I see from the interesting thread on uk.rec.models.engineering, and a posting in this thread, that the OP has now gone into his 'deflect attention' mode.

in this case he has chosen the mechanism - which he can name but doubtless will not do so - of mentioning something irrelevant to support what passes for his argument (if it can be graced with such a name). He said that "The Yanks almost certainly will not have heard of Araldite", completely missing the point that the original development of the precursors to the Araldite range were German and Swiss, and the product marketed internationally!

What a narrow outlook, slim technical base, and thin skin this chap has.

BTW, what happened to his situation that has made his plea ("Sorry - no Internet access during the week.") nugatory? Some sort of ISP failure? A 'high moral stance' in relation to a professional concern? One wonders - for a microsecond or so.

A bandpass filter can be designed as two coupled L and C tuned
circuits.

The two circuits are coupled together via the mutual inductance
between the two spaced-apart coils. As in a 455 KHz interstage
transformer in a screening can.

The degree of coupling is approximately 1/Sqrt(Q1*Q2), where Q1 and Q2
are the tuned-circuit Q's which are determined by the filter's
terminating resistances.

Closer coupling increases the bandwidth.

For details see Terman.

I think that Coilcraft, API-Delavan, Pulse, etc. would be surprised to hear them. Although I'd grant you that you don't typically find many air coils in mass-market consumer electronics anymore, they're still used all over the place in industrial and military design... where I work we buy tens of thousands of the things every year for radio receivers!

Plenty of articles appearing in QEX and on-line also use air-core coils, since it's a pretty fast and you can, of course, get whatever value you want with no "minimum purchase" quantities.

To imitate an old Volkswagen ad: Air doesn't saturate. Well, I guess it does at some point but that's way past where ferrites and iron powders do. Today many inductors in receivers are designed around iron powder cores but when it comes to heavy-duty stuff air cores are the ticket. Same for really high-Q tuning circuits.

Need to charge some SLAs and other lead acid batteries for field day Im
trying to make
something work without buying a new battery charger, so here goes.
I need to charge a alot of different voltage lead acid batterys
6,8,10,12, ect. I have a
old charger that only puts out 12-14vdc, I have a 10amp 120vac
powerstat (variac) im thinking
of adding to the input of the transformer to reduce output . Will this
work?
Im not sure about the inductance & operating a transformer @ 1/2 or
2/3 the normal 120 vac
input voltage, im wandering if this will effect efficiency or if it
will work at all.

1193. Re: Charger for field day lead acid batteries ?

Source record: 13844

There should never be a problem operating a transformer on lower voltage than it was designed for. The problem comes from operating on too high a voltage (and usually that problem is core saturation at line frequencies--or core overheating for high frequency transformers).

As for charging the batteries, you can find lots of info on "doing it right" on the web. I've found http://www.batteryuniversity.com/partone-13.htm to be pretty good. It saves a lot of work if you have a circuit do the monitoring for you, but you can do it yourself with voltage and current meters. If you get tired of looking at the meters, check out TI's UC3906 and related ap note.

Cheers,
Tom

The transformer in your existing charger will probably function as you
expect if you reduce its input voltage with a Variac.

However, there's no assurance at all that your charger's DC output
voltage will behave. If the charger has a linear voltage regulator of
some sort inside, the regulator's not going to want to track the
reduced input voltage. It'll probably run "wide open", which means
that the charger's output voltage is going to be very critically
dependent on the Variac setting. Unless you are very careful in
setting the Variac, you'll either undercharge the battery, or hit it
with too high a voltage and end up gassing away much of the electrolyte.

You might be able to alter the DC regulation circuitry in the charger,
so that it would regulate down to a lower (switch-selectable) voltage.
You might need to do both in order to charge a lower-voltage battery
without overheating the charger - reduce the input AC voltage by about
half (to cut the raw, unregulated DC voltage) and then change the
voltage-regulator setting to produce the correct fast-charge or
float-charge voltage.

Mr. Haney,

All crystals will operate on their fundamental as well as the overtone modes. Too bad they aren't working in your g-dipper. What holder are they in? Is it the old standard FT 243 (if I recall the number correctly). Channel numbers could be for anything. A simple Colpitts osc could be built to see where the fundamental is.

Use the SECOND circuit here:
http://hem.passagen.se/communication/txo.html
Use both 150 Pf. The total of C3 and VC1 can be around 50-100 pf and it should oscillate so you can measure / count the freq. R3 = 2.2K should get it going.

To get battery credit, didn't the batteries need to be charged by something other than power line current? I thought they had to be solar, wind, water etc charged so that you couldn't just plug in a battery charger into a wall and charge them the easy way.
Not to put a damper on your using batteries for field day, but you might want to check the rules. Here we use a big diesel generator for the radios, but some wanted their logging laptops plugged into the wall instead of the generator and a spirited argument broke out whether that negated the credit for not using lines power.
thanks, John.

SLAs will be Tricky. If the supply you have is regulated, the variac is not a very good idea. The transformer operation and efficiency is not an issue. It will work just fine on the variac.

However, you really need a well regulated supply and accurate voltmeter and to float them for full charge. I have two little SLAs sitting at 13.75 all the time.

Read the lead-Acid sections of this first, then decide.
http://www.batteryuniversity.com/partone.htm

Having a good background in Lead-Acid basics, you can do some things, one being:
For one battery at a time:
1- Measure voltage at start to determine charge state.
2- Calculate amp-hours to full charge (knowing the charge replacement efficiency of YOUR battery).
3- Charge with known current (like a ni-cad charger) to somewhere under 90%.
4- Measure the open ckt voltage periodically, but after the required rest period.
5- Stop before disaster happens.

OR

Just wing it. (:-)

73, Steve, K9DCI

Just kidding with the wing it thing.

1198. Re: Crystals

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-08 00:55:21 UTC
From: Henry <wa0goz@arrl.net>
Message-ID: <N4Odnd8o99Lu3HTenZ2dnUVZ_tydnZ2d@comcast.com>
Source record: 13699

If the crystals are the old WW2 crystals that are about an inch
square, the frequency is determined as follows:

If the Channel is a 2 digit number, divide the marked frequency by 54
to obtain the fundamental frequency:

Channel 32
Marked Frequency 32.2 Mc
Fundamental Frequency 32.2/54 = 429.630 MHz

If the Channel is a 3 digit number, divide the marked frequency by 72
to obtain the fundamental frequency:

Chhannel 381
Marked Frequency 38.1 Mc
Fundamental Frequency 38.1/72 = 529.166 MHz

Hope this helps and 73,

Henry WA0GOZ

If he's using batteries and not recharging them with a motor generator
or the power line, then he's running battery power and gets a
multiplier of 5. Where they were previously charged isn't an issue.

He can still charge them:

6.9. Batteries may be charged while in use. Except for Class D
stations, the batteries must be charged from a power source other than
commercial power mains. To claim the power multiplier of five, the
batteries must be charged from something other than a motor driven
generator or commercial mains.

But doesn't get the multiplier.

The spirit of the thing is that the contest is a test of emergency
preparedness. If he had the foresight to have a bank of batteries

charged when the power failed, then he is "prepared."

Considering that it's a bit warm at the end of June in Tucson and half the mountains in the state were on fire (wait till this year, 110 days without rain and counting), I stayed home and ran 1E. I could actually (and did) run for quite a while on just battery power but I periodically ran the Honda generator to charge it.

Still didn't do to badly. One man, one band and only 17 hrs on the air and still third highest number of QSOs in my category in the nation.

It would help more if you separated your MHz from KHz. Those are all WW2 tank transmitter frequencies and were for 54 X and 72 X multiplications so that it could be FM'd. The Army must have loved old Armstrong, they always used FM even when the well understood capture effect kept killing off their guys. Same reason the Air Force still can't talk to the ground pounder unless they stick an AF guy with an AM rig with them on the ground. Sigh

I whoopsed. The resulting fundamental frequency I quoted should have
been in KHz or Kc back in those days. 38.1/72 = 0.5291666 Mc or
529.1666 Kc. and 23.2/54 = 0.4296296. In the first example, my
dyslexia got me so the numbers are wrong. Sorry.

Nah. We had a surplus outfit here in Tucson that cut up old Air Force
planes at DMAFB (The Boneyard).

I bought a Collins KWM-1 from them that came out of a B-47. They were
using SSB a long time ago. I wish I had kept that radio as it might
have been very widely traveled.

Some of those planes were "special"... RB-47s. They were overflying
the Soviet Union before the U2s were.

I used to be a member of the Association of Old Crows. For more on
that see: (http://www.55srwa.org/55_crowstory.html). The author, Col.
Bruce Bailey also discussed some of these missions (and mischief) in
his book, "We See All", a Pictorial History of the 55th Strategic
Reconnaissance Wing. I happen to have an inscribed copy (no. 1474 of
1500) of the book.

Bruce has a lot more tales at http://www.55srwa.org/55_fhr1.html

Caution: Do not read any of his stuff with liquid in your mouth. It
will wind up all over your monitor.

Yes Wes, and SSB IS AM. If you were an Old Crow, you still are. By any chance know Duke Knief?

Was out to Davis Monthan last year, all those single flight C-141's was sickening. From the factory to the boneyard just to protect some congressmans turf.

From: Gary Schafer <gaschafer@comcast.net>
Message-ID: <l8viu1tcjk6igge174vrnobdr6u88q51kk@4ax.com>
Source record: 13707

I have an HP 8553B RF section for the 141T spectrum analyzer with bad first mixer diodes I think.

The old HP part number is 08553-6002 CR3, CR4, CR5, CR6.

I found a place that says the replacement is HP 10514-8454. This is a matched quad set of diodes.

Does anyone know what a generic diode part would be for this?

Thanks

Gary K4FMX

><LenAnder...@ieee.org> wrote in message

>> Bandpass filters can be designed for specific bandpass without
>> using inductive coupling.
>
>hmmm ... I had lept to the conclusion that OP was concerned about undesired
>coupling, rather than desired coupling.

To make an inductively-coupled BPF one IS concerned about DESIRED coupling. That's how all those "IF cans" have been designed for about the last 65 years (give or take). EXACT desired magnetic field coupling.

Two-resonator bandpass filters (narrow bandwidth relative to center frequency) can be done with "inductive" (magnetic field coupling), capacitive coupling in two ways, or inductor coupling (without magnetic field coupling) in two ways. Kind of old hat. I prefer the non-mag-field approach since I LIKE using toroid inductors and do NOT want any magnetic field coupling in there. Makes the packaging more flexible; i.e., no sweat.

>I think SMD inductors are typically designed so as to not maximize their
>susceptibility to objects in their vicinity, although not necessarily
>minimize it.

I've never done a mind-meld with any SMDs but I have looked in a lot of databooks, seen a lot of datasheets. SMD inductors are designed for inductance, Q, and current-carrying capacity. Unless they are SPECIALS, shielded, or some other thing stated, no one knows what their magnetic field is unless they try it out. Or discuss it with the SMD makers.

If you want to find out the magnetic field coupling, the setups have been described in the better texts for decades. It is a lot of trouble to do but that time can be amortized nicely if one is making thousands of identical IF cans (narrow percentage bandwidth bandpass filters).

>Another issue of concern is self-resonance.

NS? :-) That's a built-in concern every time one designs filters of any kind. Try a highpass filter and see where inductor (or capacitor) self-resonance messes up response.

A two-resonator type of narrow bandwidth bandpass filter
DEPENDS on resonance. Self-resonance implies a parallel
capacitance component equivalent on the inductor. That, in
turn, dictates the exact choice of fixed or trimmable
capacitor one adds across the inductor.

>Some SMD inductors have rather
>surprisingly low self-resonant frequencies.

Quantitatively define "surprisingly," sir. That is
a null statement. Show some examples of SMD inductors'
self-resonance versus other types of inductors not SMT.
Crib from existing data if you like, some does exist.

>Obviously, some designed for
>cell phone service typically won't, but it is yet another parameter to fret
>over.

Are you designing cellular telephones? There is PLENTY of OTHER
applications at UHF where some small, two-resonator BPFs can be
used. Or at VHF. Or at HF. Even at MF and LF.

"Designed for cell phone service" implies SMT, obviously. Cell
phones DEMAND smallness in the market. HOW they eventually get
so small doesn't depend solely on physical package sizes or the
other factors you allude to. I like jumping but not doing so
on conclusions.

I've been sharp and nasty in this reply. I've also skim-read a
lot of inane and time-wasting blather on the "FAQs" cross-
posted to a bunch of newsgroups...that should not have been.
I'm tired of a bunch of self-righteous arguers busy, busy
arguing for the love of arguing. :-(

In HOMEBREW the replies ought to concern themselves with more
factual responses, not cut-and-paste generalities nor inability
to understand the original question. That's the best help for
anyone who asks questions.

There are two different multipliers at work.

If it's battery then how they were charged is unimportant. All that
counts is your running on battery. If you charge them while on the
air then how you charge them counts. If off generator its differnt
than off the mains. There is a special class if you charge them using
neither generator(gas/diesel power) or mains for that see alternative
power.

If your going for the alternative power source multiplier then how the
batteries are charged counts. I think the rule says non-petropower
(gas oil or pertro byproducts) IE: Solar, unless you have a really

big solar array it's diffictult to run a radio directly from the sun (it's possible) but the rules do allow you to charge batteries from the sun and run from them. I believe you get both solar power and battery scores for that. Other sources are allowed such as water power, wind, someone peddling a genny, a old military handcrank gen would be valid examples. I was told steam powered genny running off wood or waste and a internal combustion engine running off a wood gassifier also qualifies. I suspect a diesel gen running of greasoline (used cooking grease or vegetable oil) may also qualify.

Running aux equipment like fans, lights and computers(not connected to radios) do not negate the battery or alternate energy credit/nultipliers.

I have done a 70 MHz LPF with SM inductors, though the physical spacing
wasnt close. Performance agreed roughly with theoretical, though I must
admit I did not test rigorously.
Closer coupling will widen bandwidth/lower Q.
You could use a small capacitor between parallel tuned sections as
coupling, and capacitive dividers as impedance matching

Hi !

You are raising nostagig memories.
In 60 tales those FT241 xtals were used for home brew 455 kc xtal
lattice filters for SSB transmitters and home brew receivers.

Bought some 100 pcs of them from "Jan Xtals" surplus shop in USA.
Oscillator circuit for those FT241 xtals was not so trivial as for ham
band xtals (as you experience with your dipper)
Used BC-221 to select individual xtals for lattice filters.
You can check them by measuring series resonance.
You can also make a simple J-fet oscillator

Oh those surplus times
A school boy had to consult a couple of hotel porters to change
Finmarks to USD to buy surplus xtals from USA to make lattice filter to
contruct SSB transmitter.

1220. The Weekly FAQ - it's more important than ever to stand up for what is right

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-09 17:05:24 UTC
From: Orator For Decency <radio.ham@lycos.co.uk>

What is Ham Radio?

(Preface)
It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery. Even
the Usenet newsgroups dedicated to the cause have degenerated
into a hotbed of abusive onslaughts by those who ought to know better.
However, there still exists the fundamental basis on which Ham
Radio is based, and that will never die. This FAQ ("What Is
Ham Radio?") will be regularly published and will not be
shouted or bullied down. It is important that those of a
technical bent, who are the natural seed-corn of Radio Hammery
and who gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_
to you to exert yourselves to join our fraternity! (If you find
otherwise, then perhaps you are already classing yourself in the
mediocre groups of those who are criticised in the FAQ and from
whom we _MUST_ dissociate? If so - it's never too late for
a re-taxonomisation on your part - there's nothing elitist about
us, and we welcome all those who are prepared to put themselves
out in order to join our ranks!)

-----ooooo-----
(Article)
So,.....What is Ham Radio?

Ham Radio is a technical pursuit for those who
are interested in the science of radio wave
propagation and who are also interested in the
way that their radios function. It has a long-standing
tradition of providing a source of engineers who
are born naturals.

Ham Radio awakens in its aficionados a whole-life
fascination with all things technical and gives
an all-abiding curiosity to improve one's scientific
knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience
with ones fellow man, and shows itself in the
gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that
they can construct and operate their own equipment! No-one
else has this privilege. Users, such as broadcasters,
the po lice and armed farces, CBers and mobile phone
users have to purchase ready-made gear. Manufacturers
are not licensed to operate their gear. Radio Hams
are qualified to design, build and then
operate their own pieces of equipment. They do this
with gusto, and also repair and modify their own
equipment. This is a privilege well worth the effort
to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with
relatively simple technologies at first, perhaps making
his own Wimshurst machine and primary cells. Small pieces
of test equipment follow, possibly multimeters and signal
generators. Then comes receivers and transmitters. It is with
the latter that communication with like-minded technically
motivated people takes off. The scope for technical
development grows with the years
and now encompasses DSP and DDS. There is also a great deal
of excitement in the areas of computer programming to
be learnt and applied.

The technical excitement motivates Radio Hams to compete
with each other to determine who has designed and manufactured
the best-quality station. This competitiveness is found in DXing,
competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a
desirable thing to have that there are large
numbers of people who wish to be thought of
as Radio Hams when, in fact, they are nothing
of the kind! Usually such people are a
variation of the CB Radio hobbyist; they buy their
radios off the shelf and send them back to be
repaired; they are not interested in technical discussion
and sneer at those who are; they have no idea how
their radios work inside and have no wish to find out;
they are free with rather silly personal insults;
they have not satisfied any technical qualification
and their licences prevent the use of
self-designed-and-built equipment.

These CB types engage in the competitive activities
with their Cheque-Book-purchased off-the-shelf radios
in a forlorn effort to prove that they are Radio Hams.

No _REAL_ Radio Hams are deceived by such people!

-----ooooo-----

One such CB type is the so-called "Not-Ham". Otherwise
known as the CBer-Masquerading-As-A-Radio-Ham, this type
had their background in the hobby that is CB Radio and not
in the technical pursuits that lead up to a coveted Ham licence.
Easily recognised by their boasts of the criminal activity of
11 metre SSB operation, one wonders why they don't go back to
the CB Bands if such bands are dearer in their hearts than are the Ham
Bands? No _REAL Radio Hams associate with those who made an
illegal installation of transmitting equipment before being
in possession of an appropriate licence.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist
from the _REAL_ Radio Ham is to solicit their view of the
difference between CB Radio and Ham Radio. A Radio Ham will
perceive Ham Radio to be a technical pursuit and will
perceive CB Radio to be a social communications facility
no different in essence to a land-line telephone or a
GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
could also hold a CB licence safe in the knowledge that
such a licence says no more about him than having a land-line
telephone, whilst continuing to regard Ham Radio as a separate
technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between
a Ham Radio licence and a CB Radio licence. To him, they are
sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then
tries to classify himself as the equal of the Radio
Ham when, in fact, he is nothing of the kind. A sure sign of
a CB Radio hobbyist is if he holds, or has ever held, a licence
issued under the gangrenous degeneration that is the
M3/CB Fools' Licence scheme.

-----ooooo-----

One group of people who claim to be of the standard of
Radio Hams but who are in reality nothing more than an
apology for the failure of a CBer are those class B
licensees who falsely proclaimed that they were against
the use of a Morse Test to control access to the HF
bands, until, that is, a test was introduced at their
intellectual level, the intellectual level of 6-year-olds.

6 year-olds simply lack the mathematical tool kit to
enable them to handle even the simplest algebraic manipulation
for Ohm's Law and thus, the disgraceful Class Ber's in
the aforementioned category are not Radio Hams by any stretch
of the imagination!

Remember - A sure sign of a CB Radio hobbyist is if he holds,
or has ever held, a licence issued under the gangrenous
degeneration that is the M3/CB Fools' Licence scheme!

>"Henry" <wa0goz@arrl.net> wrote in message

>It would help more if you separated your MHz from KHz. Those are all WW2
>tank transmitter frequencies and were for 54 X and 72 X multiplications so
>that it could be FM'd.

Both Rx and Tx were crystal-controlled. Those were mostly MOBILE radio sets (not restricted to armored vehicles or "tanks"). The modulation was PM, not FM, using "reactance tube" modulators prior to frequency multiplication; makes little difference to receivers at the other end since FM and PM used the same limiters-discriminators for demodulation.

Omitted from ham lore are some of the other radio sets of bygone military days, those having "crystal boxes:" The AN/TRC-1, -3, -4 VHF Radio Relay terminals and repeaters (70 to 90 MHz, design beginning around 1941-1942)...lots made but sold to other militaries after WW2, not many to surplus distributors; the original HF handie-talkie and its companion, the ill-fated "Pogo Stick" HF transceiver (both AM but the contract for the Pogo Stick was let AFTER the Army disbanded horse-mounted cavalry). Motorola (then Galvin Mfg) in Chicago made both of them.

>The Army must have loved old Armstrong, they always
>used FM even when the well understood capture effect kept killing off their
>guys.

I disagree on the "killing off their guys." Both the handie-talkie and early 1943 beginning walkie-talkie replaced an abominable three-sack four-tube high-HF/low-VHF kluge used just prior to WW2. Those two models were unsuited for ground military communications. Some invited civilians from Motorola told the Army that in 1940. The SCR-300 walkie-talkie, though cumbersome at roughly 40 pounds of single backpack, used only one crystal and that one for tuning dial calibration. The SCR-300's Tx and Rx were VFO-tuned! [marvelous design job in my estimation considering the enormous range of temperatures they underwent and the physical beating they took]

FM in mobile/portable radios was proven much more useable in 1939 to 1940 trials of police radios in various departments around the USA, principally by those sets made by Link. Galvin (later re-named Motorola after WW2) picked up on that to design the SCR-300 which was a communications success for ground-pounders. Since the SCR-300 was tunable, and in the frequency range of those "tank"

radios, ground units could communicate together as the situation demanded. The basic SCR-300 design was licensed out to several foreign militaries right after WW2 and served past the 1950s even after the replacement of the '300 by the AN/PRC-8, -9, -10 manpack high-HF/low-VHF FM transceivers (I wore a -9 a few times in 1955). It was half the weight of the older SCR-300.

In varying terrain over relatively short distances (under about 10 miles) and in the chaos of active combat, the constant-audio-level of FM and reduction of electrical noise effects worked out better than the AM radios of those days. The task was to coordinate and communicate in combat situations, not to play with gain controls or radio knobs. Consider that the "channelization" right up to the push-button channel selection on the "tank" radios made it much easier to USE in an extremely-busy-with-other-things combat situation. Playing with radios was a no-no when there are bad guys out there determined to snuff you out; attention can NOT be disturbed in such conditions.

I'll disagree that the "capture effect" was either a buzzword at the time or responsible for some alleged disturbance to vital communications. Even with the crude AVC (what is now AGC) of AM receivers back then, a stronger AM signal on the same frequency could blot out a weaker AM signal every bit as much as any FM limiter action doing the same. "Capture effect" buzzphrases were popularized after WW2 and after the Korean War of '50-'53.

The migration to VHF for relatively short-distance comms had begun DURING WW2. The "three-band" system of overlapping frequency bands for infantry-artillery-armor in high-HF/low-VHF was planned for post-WW2 military land forces use as a result of lessons learned during WW2 by the USA and USMC. That plan was in use for two decades, including the beginning of the Vietnam War. The many-made AN/PRC-25 (later -77) of later Vietnam War fame was VHF as a result of long experience in what worked and what didn't.

>Same reason the Air Force still can't talk to the ground pounder
>unless they stick an AF guy with an AM rig with them on the ground. Sigh

Way untrue now. Airborne radios went VHF and AM for different reasons beginning in later WW2 years. Airborne short-distance (up to about 50 miles) can use relatively low-power Tx and with tube architecture an AM Tx is less complex and weighed much less. Weight in earlier aviation was still a driving factor in what was bolted on an airframe. [still is, but a moot point considering the marvels of solid-state miniaturization]

ICAO (International Civil Aviation Organization) rules specified VHF AM at 108 to 137 MHz in 1955 on the basis of WW2 designs and experience. Around the same time, the USAF (now a separate U.S. military branch) standardized on 225-400 MHz UHF, AM, for

airborne communications. [see the ubiquitous old AN/ARC-27 for a good example of airborne "push-button" channelization reducing the need for playing with knobs in cockpits] None of those were sharing any bands with folks on the ground. In actual use, it was preferred to have air comms on DIFFERENT bands than surface comms to avoid radio congestion.

A former neighbor was both a B-26 pilot and a Forward Air Controller in Korea of the early 50s. Not the glamorous roles shown in the movies but a decided advantage to have "an AF guy" as the FAC because they KNEW how to talk to and direct the flyboys whereas ground-pounders weren't familiar with their needs, even to help out the guys on the ground needing support.

A lot of that began changing in the later 1960s with specific ground equipment that could communicate with airborne radios being procured. The SINCGARS family of VHF radios has four specific models, 1 manpack, 2 vehicle/transportable, 1 airborne to get everyone involved in coordination of nasty-business action. [there's as much Army aviation used for land forces support as there are USAF for the same role] A quarter-million SINCGARS R/Ts have been produced and made operational since 1989 and the successor is about to debut (see Harris Corporation detailed PR). Frequency-synthesized as are all military radios now, no boxes of crystals to lug around.

The new generations of military radios appearing now cover frequencies from 30 MHz on up to the top of the airborne military comm band...and any mode-modulation as needed, the emphasis on digital (for encryption) and frequency-hopping (to make RDF extremely hard for the "other side").

Nobody can hope for cheap, easy-to-convert for ham use "surplus" radios now. :-(There haven't been any "surplus" quartz crystals from the military for decades...although there might be some from the 2nd and 3rd generation of VHF "tank" radios when those are taken out of storage. During the last three years of WW2, the USA produced an average of a MILLION quartz crystal units a month! No wonder there were surplus crystal units made available later.

I can't vouchesafe John's decision to give up his treasured gear,
but I can say John's loss is my gain. John's 8566B is a beautiful
machine and several of us are having lots of fun with it. My tech
is making a new rack for it (and several other machines, together
far too big to fit on a bench), then I'll add an ethernet-to-GPIB
network connection, software, and it'll be ready for prime time.

<snippety-two>

Wow... Good point! I hadn't even thought of that.

Still... If those silly "FAQ" posts are coming from who I think
they're from (a morphed Airy R. Bean), then yes, I'm pretty sure
s/h/e/it is, in fact, licensed.

As to what, exactly, said license is for, well, that's another
subject for debate. ;-)

how to effectively put an analog-meter's clear plastic cover at dc
ground, to prevent buildup of static charge?

Hi...

Wipe it down with a clean cloth moistened with just a bit of
dilute liquid fabrid softener occasionally :)

Take care.

Ken

Ha, that's a good one. Try an anti-static liquid or spray. You can buy
(expensive) stuff for electronics or try a consumer anti-static spray
compatible with the plastic (probably acrylic). Test before spraying
it all over the cover.

Best regards,
Spehro Pefhany

Replace the movement with a digital readout.

I assumed the problem was false readings caused by static charge.

In Lieu of sprays & wet stuff--get one of those fabric-softner paper
rags ya throw in the drier to stop static kling. get a string anywhere
from 24 to 37 inches long, tie one end of it to the paper towel, & the
other end to a place you can reach in the cockpit.

wipe meter occasionally..

Jerry

Commercially this is done with a very thin metallic film over the
plastic... so thin that it's not visible.

I don't know if there's a DIY way to do it.

The RG-214 cable I ordered from Germany to make up some patch leads for my VNA has finally arrived. It was advertised as "high-end audio cable" which is what it's commonly sold as over there (those wacky Germans!) but it *is* the real deal low-loss 50 ohm UHF cable, nevertheless (just as well since it took 3 months to arrive).

Now I have to make up these leads with N-type connectors to replace the stock leads that didn't come with the analyzer. These hook up the VNA to the Transmission/Reflection Test Set (which I do have). I see from HP's tech spec that the interconnects I need to copy comprise what was originally sold as the "11851A RF cable kit" and it consists of four cables. Now here's the tricky bit:

"Kit includes three 24" 50 ohm cables, phase-matched to 4 degrees @ 1300Mhz and one 34" cable. The 34" cable is used to phase balance the transmission path of the Transmission/Reflection Test Set."

So does this mean the cable lengths are critical and if so, how best to go about making them up?

thanks,
p.

I realize that this kind of behavior is common on most of the net,
but it is NOT welcome at RAH.

Please take your ugly attitude (and language) and go away until
you can display some maturity and a bit of self control.

Richard

I had this problem with a Simpson 260 years ago. Some uninformed person used
something to wipe the plastic screen/cover with something that imparted
static. Drove the needle crazy.
I ended up replacing the screen/cover and the problem when away.

I do not think that grounding the screen, non conductive to the dc ground is
going to help.
but I have been wrong before.

I'd brush up on my N connector soldering, so I can get it in a consistent
place relative to the end of the cable, and just measure four cables of 24"
minus 2X whatever the length of the rest of the N connector is, and
possibly put them in some kind of jig.

It doesn't sound like it's the _length_ that's critical, but the _matching_
of those lengths.

About the 34" cable, I have no idea what the rest of that sentence means. ;-)

Cheers!
Rich

With a little practice, you can get the needle to point just about
anywhere you want! 'Comes in handy when you are trying to impress
someone with a good reading about some quantity! By the way, not
limited to plastic. Glass faces hold the charge well, too!

Use what's at hand. On one occasion, I used fine wire cloth inside the
cover (grounded, of course). In RF transmitters, we used wire cloth not
to prevent static build-up, but to prevent RF leakage from the rack.

Hi !

Visit the nearest university where is an electron microscope.
They have sputter devices to cover EM samples with a thin gold, silver
or carbon layer.

Maybe you can motivate them to sputter your meter front plate with a
thin and practically invisible gold layer .
Ask them to sputter the inside of the plate.
They have also silver paint for SEM samples
You need to paint a narrow conductor outside from this sputtered inner
surface to ground the sputtered area.
Best to paint a conductor to all 4 corners

Once I sputtered a table tennisball with gold.
The idea was to make a very light corona hat for a low band wire
vertical lifted by helium balloon

Dish washing soap? IIRC, something similar is used in anti-stat baggies.

When I worked at EIL many years ago as a meter technician, we had antistatic spray that we applied both inside and outside the plastic meter covers. It was probably very similar to a detergent or fabric softener. I think such sprays are still available from Tech-Spray or similar suppliers, and also places that cater to electronics repair, like MCM. I think antistatic sprays are also used on drive belts in VCRs and tape players.

Some meters I worked on had a metal plate on the lower part of the inside cover, and it was connected to the frame of the movement with a small leaf spring.

I have seen some sensitive meters where the pointer could be dragged to half scale, and would stay there for a while, by rubbing the outside of the plastic cover. This is certainly a concern for accuracy. The older glass cover windows did not have such problems with static.

Yes, you probably do want the cables to be the same length electrically, especially if you don't have an automatic way to apply a calibration correction, just for convenience if nothing else. 4 degrees at 1300MHz is about 1.5mm, assuming solid polyethylene dielectric. You may be able to achieve that sort of matching if you are really careful in your construction. What sort of connectors are you using? If they are they type where you solder or crimp the pin to the center conductor and put the line into the body of the connector until the dielectric hits the dielectric of the connector, you should be able to come close to that sort of match in physical length by very accurately matching the length of the dielectric, and cutting it very cleanly perpendicular to the axis of the coax. If you're using good coax, the variation in velocity factor from piece to piece should be small, and so as long as you don't try to make really long cables, you should do well.

Note that you can calibrate out lead length differences. A difference leads presumably to a phase error that ramps linearly with frequency. Does your VNA have a way to remove/add a time or at least a constant phase to the readout? And you can perhaps arrange to measure the electrical length differences. If you can do that, then you can make up, say, four of the 24" (nom) cables, and pick two matching ones to go to the two receiver inputs. Note that the length from the source to the coupler (T/R test set) is NOT CRITICAL at all. So make some cables as close to the same as you can, and pick the best-matched two for the receiver cables. That should let you make good reflection measurements. Then you can either adjust the length of the longer cable, or calibrate out its length error, for transmission measurements, assuming you care about phase. Often you'd have to account for the length of connectors and other cables to your DUT anyway.

I've made some measurements on some rather expensive test cables and found the electrical length to vary more than I'd have expected, though they weren't matched sets. I'd hate to have to select a matched set from such cables, though, as it would take quite a few cables to assure that I'd get two that matched close enough! For several hundred dollars per cable, I'd have expected they'd hold them closer to the nominal length.

Cheers,
Tom

(Note that some extra care is taken in the design and construction of the coupler to get accurately matched paths to the two receiver outputs!)

Carbon works best for this particular problem but can't be Sputtered
ie. You need to use the High Vaccumn set-up to Evaporate a Carbon Film.
I think the Fabric Softener is the more practical way for most people.
The Carbon film is used to reduce charging problems with the Electron
beam ! And the fabric softener is incompatible with the Ultra High
Vacuumn systems used .

RE Sputter coated Tennis ball, Talk about taking the phrase "Gilding the
Lily" to new heights !! A small sheet of aluminum foil would have done
as well, but would not look as impressive.

Been there done that.

BTW a modification of the Carbon Coating Process is used to produce a Diamond Coating on high-tech surfaces.

Tin oxide has been an industry standard evaporated conductive film since
at least the late 50s. It is used today as wiring for TFT displays.

Has anyone any info on servicing one of these?

The power control is out of alignment (about 3/4 of the way up it suddenly jumps into TX at full power, with it being very sensitive to get any control between full and no power).

Possibly a bias problem on the PA?

And the power meter needs re-aligning.

And the FM deviation is too high.

Can anyone point me towards the internal pots?

Thanks,

Sam

Hiya Sam, I had one of these, I am sure the FM pot is on the 'local' board, which is the one with the patch/ptt/CAT sockets on. VR02 I am sure, and it feeds the fm af amp transistor, q2008. As for the power control, they are very 'jumpy', all on or off, and very narrow over the operating range, sure yours is just as they are. I also still have the mobile mount for it in the loft, I think!!!!!!!!
Cheers, Fred G4ZWI

Hi Fred...

Ah, never mind then, I'll have to live with it (well not me, I'm asking on behalf of a friend).

Any ideas about the meter though, that needs re-calibrating.

Sam

Never had to tweak that one Sam. There is a preset near the meter
driver circuit, (An6552, Q51, on the R.F. board.) That may be the one.
There is a 'pot' to set the FSD of the meter on Tx (for SWR forward
reading, obviously you set it to full scale, then set the swr switch to
reverse.) It is not that this control has been set too far up?? (Its on
the back of the unit, under the antenna socket, marked 'fwd set'?)
Best of luck, mate, I have got a few bits of cct diagrams if you are
really stuck, and may help....
Fred

1264. 'Radio Spares' High Power Voltage Regulator spec ?

Source record: 13615

Recently I acquired a DC PSU with a RS High Power Voltage Regulator RS stock nr 30-541-2. Embossed is the code : D7140
The device integrated on a substantial heat sink is probably 20 + yrs old . It was made in the UK
I can't find any reference in any RS catalogue or on their web site.
The device has 5 pins :
pin 1 + DC input
pin2 - DC input

pin3 and 4 are wire-connected

pin3,4 + output
pin 5 - output

A varying input voltage gives a lower varying output voltage .

The associated transformer (also a RS component) has the following (centre-tapped) secondary 13.5 - 0 - 13,5 V @ 3A with bridge rectifier and the 4 electrolytic capacitors (all in parallel) are having a working voltage of 25 V , so it highly likely was a 20to24 V-DC PSU Any spec. info regarding the heat-sinked device will be much appreciated.

Frank GM0CSZ / KN6WH

the full ervice manual is on mod.dk site
the power variable on the front panel always was 'iffy' though a squirt of cleaner (not WD40) might help.
dont forget as the other gent says, the SWR pot on the back will effect the meter PO scale.
also it is caled into 50R so will not read correct of an aerial or ATU. as such.

if you wish help
pse ask

done loads and own one since 1985

Hi

Seems really to be a pentode

Here is one links found by Google
http://cgi.ebay.co.uk/GU-46-4-1000A-QB5-1750-1000-W-Glass-Amplifier-Pentod_W0QQitemZ5860722528QQcategoryZ48710QQcmdZViewItem
There is be a mistake in the link European symbol QB means tetrode
Pentode is typed as QE
Here is a russian link
http://www.tubes.ru/techinfo/Broadcast/gu-46.html

As in linear amplifiers I remember them beeing used in grounded grid
circuit (all grids bound together and RF earthed and zener biased for
correct AB class)
Drive to filament where ferrite rod chokes are used.

I have used above mentioned tetrode QB 5/1750 successfully in
GG-linear amplifier.

Suggest you go to the web sites of the manufacturers of the particular terminal boards you're interested in and download specifications (usually pdf documents) that should give you such info; same with the spade lugs. But generally both would be spec'd for standard screw sizes: numbers (4, 5, 6, 8, ...) in the US and metric (millimeters) pretty much everywhere else. Those of us in the US that manufacture for the international market really are using metric wherever possible, and some day someone with some real leadership will wake up and get us really converted over to metric. Sigh. BTW, you can (or at least used to be able to) get rows of spade lugs on an insulating strip to match particular barrier terminal blocks, both from the same manufacturer.

I think you might benefit from looking through the Keystone Electronics
catalog, they have some dimensional drawings.

> by the way, how are spade lugs sized?

In the US, #5 or #6 screws are the most common on small barrier
terminal strips. Spade lugs are available in #2, #4, #6, #8, #10, 1/4"
etc. screw sizes.

Tim.

There's a 2-35V, 2A, adjustable, high power PSU, RS stock #308-152, in the
1985 catalogue (£23.28!). Has same pinouts and on a big square finned
heatsink, maybe similar item?.

Hi all,
i've recently acquired this funny box, assembled by the previous owner.
I'd like to add a digital frequency counter (i've a couple waiting on the
bench)
and a tuning indicator, anyone tried this before and having schematics or
hints
of where to take the correct signal?
Thanks in advance,

>
> I would be interested in hearing which ones you recall.

I don't know how many they've had, but I remember being overjoyed one Christmas when I got the 50-in-1 kit. It was the one with the wooden case, and all the components were on the main board with spring connections.

I just bought one for my grandson for last Christmas. This one was 200-in-1 and had several ICs for mounting on a breadboard system. Some components were mounted on the main board with spring connections, like the various potentiometers, LEDs and such. VERY nice system. We spent several hours going through some of the projects. He's having a great time with it!

Thank you, RS!

I'm going to attempt to build one of my ghost receievers dead bug style. The goal being to take something that I usually mount in an old PC case, and fit it into a cigar box. I've never tried dead bug, or ugly construction, but figure it should be the most spacerous mehtod, and I cany use both side of a board for seperate functions.

As far as my ghost receivers, just remember those proclaiming something is impossible are interupted by someone doing it. Believe it or not, like it or not, the dead talk! This IS the next frontier in electronics!

http://franksumption.tripod.com/

I still haven't quite gotten the LNM3820 to work the way I want it to. It works on the bread board, but not on a PCB.

Hello there,

I'm looking for you old tired stack of 73 and Ham Radio Magazines just to read at my pleasure. I'll be scanning some of the better articles into pdf files and making them available to others for free. Many of you have already seen the www.radiowrench.com/sonic web page.

If you'd like to donate or sell cheap your old mags, I'd like to have them. Where practical, I'll pay the shipping/postage and a bit for your time.

Please take the NOSPAMPLEASE from my email address below and drop me a line if you'd like to part with some old magazines...

Source record: 13640

New Program - OP_ANGLE.exe

This program assists with understanding, choosing and setting the
operating angles of Class-B and Class-C RF power amplifiers.

The operating angle underlies all performance characteristics.

Although RF operating conditions for tubes can be set up using
manufacturers' data sheets, the program refers to use of a tube's
Operating Characteristic Curves.

Download program OP_ANGLE in a few seconds from website below. Not
zipped up. Run immediately. File size = 39 kilobytes.

I have an old 1950 Radio Experiment magazine with all sorts of tube
projects. It's yellowed and falling apart. I'm trying to scan it
and wanted to post the scans someplace. I started posting on the
alt.binaries.photo.radio and rec.antique.radio+phono newsgroups
and got lots of good ideas on how to adjust my scanner and what
format to save it in. When I have the time to scan all 160 pages
I'd like to make this available (I don't have the web space and
the binaries news groups only have a life time of a few days).

I have lots of old (1966-1973) pop'tronics magazines and some
1970-1980 CQ and assorted 73's someplace. I know I have
the very first 2 73 magazines hidden someplace. Also late 60's
electronics illustrated magazines. Eventually, I'd like to scan
all of them and make them available.

I think the ARRL now has the rights to Ham Radio and you can buy
CD's from them. I don't know who has the rights to 73, but I suspect
Wayne never gave that up. Pop'tronics was part of Gensback up to a few
years ago (maybe he only got the right to the NAME and not the original
magazine contents.) Of the other electronics magazines which are
long out of bussiness .... who knows?

I would classify as follows -

Class A: Operating angle = 360 degrees.
Class AB: Operating angle = 180-200 degrees.
Class B: Operating angle = 180 degrees.
Class C: Operating angle = less than 180 degrees but usually between
150 and 110 degrees.

I don't know about the others but they are probably not defined by
operating angles.

Reg, G4FGQ.

Somewhere around I have several old Pop'tronics mags from the 50's --
including the very first from Oct. 1954.

>CD's from them.

Not quite. Communications Technology, Inc. (parent to Ham Radio
Magazine) was sold to CQ in 1990. CQ scanned and produced the
3-volume set of CDs containing all 22 years of HR's articles.
ARRL resells a lot of products. That doesn't mean they "own"
the copyright. ARRL resells a lot of RSGB publications but
doesn't own the copyrights of the Radio Society of Great Britain.

> I don't know who has the rights to 73, but I suspect

>long out of bussiness .... who knows?

Copyrights are valid from the first publication until 50 years
after the death of the copyright holder. [death of a corporation
presumably is the same as total quitting of it] "Publication" is
almost any form of media that is visible to the "public," and
that includes anything written on the Internet as an example.

One doesn't have to "file papers" to establish a copyright
although that is most convenient if some civil court dispute
comes to trial. Copyright suits are almost always held in
a civil court, not a criminal court; the federal government
can bring suit in a federal court for flagrant violations of
the copyright law.

The "copyright law" is in Title 17, United States Code. One of
the big revisions of United States copyright law was Public Law

94-553, 17 October 1976. In the USA, Congress maintains the Copyright Office. Congress has a rather large website which includes much information on copyrights (you can search under "copyright law" to get the URL...nice FAQ on copyrights there).

Depending on the terms of a "work" sold to a publisher, the publisher usually has first rights (as in copyrights) to that work. The author may, depending on the contract (the monetary compensation) may have the right to publish/distribute that work AFTER the first-rights holder has published it. In my case, I can repro and distribute any article that I authored in HR as I wish...the conditions of my compensation contract. I cannot do the same with any article I edited for them; such is not considered "original work."

In short, you just can't willy-nilly repro any work from a private/civilian-business publisher without their permission. You CAN repro any work done by the United States government; the US government is forbidden by law to hold copyrights. Note: The US government CAN hold a patent, but patents are a different category and handled by a different agency.

A grey area is the "fair use" part of the copyright law. A "fair use" item is PART of the original work which can be used by itself as a reference or partial reproduction in a news article or textbook. Almost all textbooks contain such items and it is politely customary to refer to the original if that is done.

AFAIK a well-designed Butler oscillator will have the lowest jitter, but I doubt that you could do the "well designed" part without a lot of bench work.

Any of the rest (considering a "Clapp" oscillator to mean a crystal oscillator with rubbering) are good enough for communications work.

I suggest keeping more like $20,000. The last time I checked with my lawyer, that was the maximum penalty for willful copyright infringement, in addition to any monetary damages which could be proved. All that's necessary to get the $20k, I was told, is to prove that the infringement was willful, not that any financial damage occurred. But that was quite a number of years ago, and in any case this shouldn't be taken as legal advice or fact. Anyone contemplating willful infringement would be well advised to check with his own lawyer. Tangling with that "one asshole guy" could be an experience to remember.

People seem to have less and less compunction against stealing intellectual property, I suppose because it keeps getting easier to do. Rationalizations are as diverse and original as fertile minds can create. The ultimate result will be that eventually, nobody will bother creating anything original.

Incidentally, I was told by the ARRL that authors of articles in all their publications are given blanket permission to put a copy of articles they've written on their own web site, with appropriate acknowledgment that the ARRL owns the copyright and reproduction is by permission. That's generous of them.

As a generalization, I think that any circuit that excites the crystal's series resonant mode will probably outperform a circuit that excites the parallel resonant mode, because the series resonance is higher Q and is less affected by external influences.

FWIW, ADI recommends a Butler oscillator for use with their DDS chips,
for minimum jitter.

"Highest performance"? Is that output amplitude? Or minimum startup time? Or startup reliability? Or lowest power requirement? Or what?

Jitter, that's a little easier to define but it's usually not the most relevant parameter in radio. It is related to sideband and phase noise and in fact cannot be completely decoupled from either.

All the simgle-transistor oscillators start with gain > 1 for low signal levels, and then as the signal builds up so do the nonlinearities (saturation of the active device mostly, but there are other kinds) the gain drops to 1.

If you only have a single transistor, the nonlinearities can be minimized by using a nice high-Q tuned tank circuit.

If you really care about jitter/phase/sideband noise, you probably do not run the active device into the nonlinear region but have an AGC loop that keeps the amplitude at a nice lowish level. This adds a few active devices.

To go a little further you get into a Meacham-bridge type circuit. These are lots of fun to play with.

Google "Sulzer Oscillator" while you're at it, there are schematics out there.

Be sure to hit www.karlquist.com and www.leapsecond.com when you see them come up in Google searches to see the pinnacles of technology.

Realistically in most homebrew radios just having your oscillator start up reliably all the time is the biggest factor :-)

Its not for a radio. I want to minimize the cycle to cycle variations in timing and it should be simple enough to make with 1 or 2 transitors. So not looking for NASA spec stuff, just reliable so it starts every time.

Most reliable to start up you will find are the
crystal-oscillator-in-a-can. They also often spec some numbers with
respect to jitter.

The TCXO-in-a-can or VCTCXO-in-a-can made for telecom use are
particularly good bang-for-the-buck if you also want low jitter.

Tim.

This might be better posted at college libraries in the copy rooms where students routinely Xerox entire books ostensibly because they can't afford the real thing (which I suspect is rarely true, and it's usually more a case of wanting to spend the money on an Xbox rather than a book)... rather than at some ham who's scanning old magazines as a form of public service when the originals are difficult to obtain for an audience that generally would pay for them if they were.

> People seem to have less and less compunction against stealing intellectual
> property, I suppose because it keeps getting easier to do.

I agree with you in general, although I think that scanning old magazines and books falls into a gray area where one is -- in all likelihood -- breaking the letter of the law but generally not its spirit. I accept rationalizations along those lines, just as I can't really fault someone who decided so travel 100Mph through some utterly uninhabited random road in Eastern Oregon. :-) Still, anyone who is hauled into court can't really complain, but personally I'd hope that some lawyer hoping to make an example would choose someone posting to alt.binaries.e-book.technical (where 99% of the posts are clear violations of the letter and spirit of copyright law) rather than the OP.

> Rationalizations are as diverse and original as fertile minds can create.
> The ultimate result will be that eventually, nobody will bother creating
> anything original.

Only in some sort of idealist world. In the real world, original creations will be generated so long as doing so puts bread on the table. Would you rather sell 1,000 copies of a 99% copy-proof program at $10,000 each or 1,000,000 copies of a pretty-readily-copyable program at $100 each? Bill Gates clearly prefers the later.

As you're probably aware, Don Lancaster makes a good point that the oft-heralded intellectual property protection device of the patent really doesn't do you much good in the real world, at least until you're a very large company. Tektronix seemed to be using this approach decades back when the comprehensive use of T-coils to obtain wider frequency respones was a

well-protected inside secret, no?

I suppose it is, but these days you can't make any decent money writing for the ARRL or the magazines, and as such publications have to be pretty generous in what they offer because they're effectively asking for significant donations of intellectual property by their authors.

Hi !

Any of those oscillators is OK if resonance circuit Q is kept high and
oscillation power in average low level.
High Q will guarantee easy and fast starting every time
Average low level keeps components cool and cycle to cycle variations
are reduced
Third important question is loading the oscillator.
High impedance FET buffer which is not galvanic ally connected to
oscillator is very good solution.
The gate of buffer FET can be provided with an "antenna" wire
collecting tiny energy from the oscillator resonance circuit.
This kind of loose coupling guarantees that effects of external
variations are minimized.

These principles also guarantee that buffer will amplify 1st order and
upper harmonics are powerfully reduced (in oscillator and in first buffer)
I have experienced superior results with these guidelines when
constructing LC oscillators

Unrelated "rationalizations." Breaking a law or rules or other
directives is still BREAKING something, purloining someone's
original work. Stealing.

In the exact words of THE LAW (copyright law in this case), it is
okay to make a copy FOR A VERY LIMITED USE such as a personal
reference or to help a friend. Where it becomes a BREAKING is if
it is done TO MAKE MONEY IN COPYING or gain something that
"belonged" to the original author (such as gain a reputation
without working for that "rep").

In Roy's case on EZNEC, he put in a lot of work in translation
of (totally copyable by law) U.S. government work into a useful
program of antenna analysis. Roy gets return on his investment of
time and uniqueness of result presentation on a computer by
selling copies of his work for money. There SHOULD be some
protection for such work by anyone in order to foster and preserve
original work...else there wouldn't be any point in doing original
work other than uncompensated personal pleasure in doing so.

>Still, anyone who is hauled into court can't really complain, but personally
>I'd hope that some lawyer hoping to make an example would choose someone
>posting to alt.binaries.e-book.technical (where 99% of the posts are clear

No, such copyright-specialist attorneys wouldn't bother with such
small potatoes. They would go after the BIG violators...DVD

and CD copiers and those manufacturing firms making knock-off
copies of goods, the stealing of imagery (in graphics or words)
and trying to imply they are "as good" as a well-known brand.

>> Rationalizations are as diverse and original as fertile minds can create.
>> The ultimate result will be that eventually, nobody will bother creating
>> anything original.

ABSOLUTELY TRUE!

>Only in some sort of idealist world. In the real world, original creations
>will be generated so long as doing so puts bread on the table.

THIS is the real world. There's no "special case" that justifies
that idealistic rationalization you made...it is circular logic in
itself...in the real world.

"Originality" may occur in humans for a variety of reasons, usually
done to improve a personal situation, a way of doing things easier,
doing it better, so forth. However, the "originality" does NOT, by
itself, "put bread on the table." To do that requires much more
personal investment and effort to make the money that buys the
bread that is put on the table.

EZNEC is an example that applies here. The work that Roy did on
translation of (free) code, cleaning it up, making it presentable
in a meaningful manner to users, was considerable, much more so
than just getting the original program code to work. Why should
Roy give away such effort? To perform such a service "for the
good of hobbyists?" Hardly worth it to Roy. So, who else would
do so? Other than someone wanting a return on their investment
of time and effort?

Anyone can get a copy of the Methods of Moments computer program
written for the U.S. government. For free (discounting cost of
on-line charges for accessing the few sites having it). I have
an older copy. BIG it is! HUGE. My old copy is written in
FORTRAN (which I happen to speak). What it does NOT have for free
is a way of showing the results in anything but tabular form, no
graphics to instantly show the antenna patterns, VSWR of feed
point, RF currents, etc. If you don't speak tabular, the original
becomes WORK in trying to "see" the results. WORK, mind-sweat,
slogging through numbers that are seldom intuitive to everyone
without the graphic presentation. Roy MADE the graphical
presentation possible through his efforts. So did others in their
different adaptations of Method of Moments analysis programs.

>Would you
>rather sell 1,000 copies of a 99% copy-proof program at $10,000 each or
>1,000,000 copies of a pretty-readily-copyable program at $100 each? Bill
>Gates clearly prefers the later.

Bill Gates, Paul Allen, Microsoft are IRRELEVANT here. There's
NO SUCH THING as a "copy-proof program." If it is a useable
program, then it CAN - eventually - be copied; the only true
"copy-proof program" is something that no one can use.

Microsoft became a software giant through lots and lots of OTHER
kinds of time/effort investment plus savvy in salesmanship...not
to overlook their Big Break in selling their operating system
(with THEM still owning the copyrights) to IBM for the IBM PC.

Without the protection of the copyright law, Microsoft could
never have made that Big Break that started their humongous
incoming cash flow.

>As you're probably aware, Don Lancaster makes a good point that the
>oft-heralded intellectual property protection device of the patent really
>doesn't do you much good in the real world, at least until you're a very large
>company.

Don Lancaster is a clever writer and marketer of himself, not a
guru of electronics. Patent Law is a separate issue from
copyright law. The protection of original work is the same in
principle.

> Tektronix seemed to be using this approach decades back when the
>comprehensive use of T-coils to obtain wider frequency respones was a
>well-protected inside secret, no?

"T-coils?" Wide bandwidth video amplifiers were no big secret
in the later 1940s when Vollum got Tektronix started with the
first accurate, reproducible oscilloscopes...accurate in their
sweep timing as well as vertical volts per division scaling.
Note: I began electronics using a Tektronix 511AD after trying
to get a Dumont 'scope kluge to yield meaningful results. Not
the same animal. Lots and lots of OTHER innovations inside the
Tektronix 'scopes that made their reputation in later years.

>> Incidentally, I was told by the ARRL that authors of articles in all their
>> publications are given blanket permission to put a copy of articles they've
>> written on their own web site, with appropriate acknowledgment that the ARRL
>> owns the copyright and reproduction is by permission. That's generous of
>> them.

[no, NOT "generous"...see following]

>I suppose it is, but these days you can't make any decent money writing for
>the ARRL or the magazines, and as such publications have to be pretty generous
>in what they offer because they're effectively asking for significant
>donations of intellectual property by their authors.

ARRL is primarily a publishing house in order to make the rest of
their organization viable. As such, ALL work for them is on a
"first rights" basis. That is, they get first crack at publishing
a contracted work...AND the continued publishing of such work for

years without ANY extra compensation to authors. It's essentially
the same as the "ego press" (private publishers who are just
preparer-printers where the author pays for that printing service).

The only ones who make any money in hobby publications are the
publishers themselves. Look at the author's compensation statements
on the ARRL website to see how little money authors receive.
Authors
get mainly the ego-trip of Being Published. For some that is
compensation enough, but ego money doesn't put bread on the table.

Been there, done that, got the table and the bread.

Hi all,

I have to make up some highly accurate length RG-214 coax patch leads
for network analyzer interconnects up to 1.3Ghz. I have the cable and
the male N-type plugs to terminate them with.
So how best to trim this cable to maintain its 50 ohm impedance as
the plugs are joined to the cable? The plugs' center pins are
solder-type; the shielding Otoh is clamped in place. Are there any
fool-proof cutting dimensions to get the result right every time?
THanks,
Paul

Ham Radio is available by the boxload at every ham radio
flea market I've ever been to. It's also available on CDROM
from the ARRL. Handy, because it's better-indexed than
the paper magazine ever was.

"Because I'm a cheap screw" has never been an excuse for
copyright infringement.

There are quite a number of styles of N connector, and each is a bit different. Cable stripping dimensions for a couple of the more common ones are shown in the ARRL Handbook, and you might be able to find instructions for your particular connector on the manufacturer's web site. I'd say the most important thing is to make sure the center conductor pin protrudes the correct distance, and make sure the cable end of the center conductor pin is against the insulation. That is, there shouldn't be any place where air is the only dielectric between inner and outer conductors except along the large diameter portion of the center pin.

My advice is based more on extensive experience with time domain reflectometry than on a great deal of experience making precision cables with N connectors. Hopefully someone with more actual connector experience will comment further.

Glad to hear it's working well. Agreed, its size and weight is a real problem, and not just for shipping. I'll definitely own another of those beasts at some point, when I have more room than I do now. The important thing is that it's in appreciative hands. :-)

If you plan to use my GPIB software with it, be sure to download a recent copy. I hosed the phase-noise app pretty badly in my last "slipstream" update a few weeks ago, and only heard about it last week. The version that's up there now is fine.

Thanks, Roy. This is *totally* uncharted territory for me so any
advice is welcome.
I guess even if I can't get any cross sectional drawings of the
N-types off the net I could perhaps measure the required cut from
probing the connectors themselves with a dial caliper depth gauge -
which I happen to have. That ought to be the most accurate way of
going about it, I guess.
Is the amount of braid one clamps up into the plug important? Does it
matter if it gets twisted slightly (where it's doubled back down over
the outside of the outer insulation)?
Thanks,
p.

Details of how the braid is clamped will affect the physical ruggedness of the assembly, but it shouldn't affect the electrical characteristics. I don't understand about doubling it back over the insulation, though.

Remember that virtually all the current is flowing on the outside of the inner conductor and the inside of the outer conductor. What you're trying to do is maintain a constant impedance as the signal goes through the connector. This means that at places where the dielectric is absent, as in the mating area, the inner conductor has to become larger and closer to the outer conductor. If the dielectric is absent at any point where it should be present, you'll have a high impedance in that region. Any place where the center conductor changes diameter, there has to be a corresponding change in the spacing to the outer conductor and/or a change in the dielectric. The connector is carefully designed to do all this, but as you're well aware, it'll only work out as designed if it's assembled correctly.

Roy makes some good points. However, for this application, I think
what is also important is that the cables be identical.

If you make the same mistake on all of them then they are still
"identical".

Lay them out and cut them all at the same time. To reinforce what Roy
said, one thing you absolutely -do not- want to happen is to have the
center pin protrude too far. If it bottoms in the mating connector on
your analyzer and damages it you will not be a happy camper.

I would agree with that. Making copies of available magazines
for posting on download sites is a clear violation of copyright.
HOWEVER, making copies of out of print, rare, un-obtainable
magazines that have a value to collectors might be viewed
by some in another light. One could even say we are saving
a valuable resource from becoming lost forever.

If it oscillates it doesn't matter about the type of oscillator
circuit.

There's no need to worry yourself.

Performance all depends on the cut of the crystal which you have
already decided upon without giving it much thought.

Just connect it up in the most simple circuit and away you go.

Reg.

What is Ham Radio?

(Preface)
It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery. Even
the Usenet newsgroups dedicated to the cause have degenerated
into a hotbed of abusive onslaughts by those who ought to know better.
However, there still exists the fundamental basis on which Ham
Radio is based, and that will never die. This FAQ ("What Is
Ham Radio?") will be regularly published and will not be
shouted or bullied down. It is important that those of a
technical bent, who are the natural seed-corn of Radio Hammery
and who gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_
to you to exert yourselves to join our fraternity! (If you find
otherwise, then perhaps you are already classing yourself in the
mediocre groups of those who are criticised in the FAQ and from
whom we _MUST_ dissociate? If so - it's never too late for
a re-taxonomisation on your part - there's nothing elitist about
us, and we welcome all those who are prepared to put themselves
out in order to join our ranks!)

-----ooooo-----
(Article)
So,.....What is Ham Radio?

Ham Radio is a technical pursuit for those who
are interested in the science of radio wave
propagation and who are also interested in the
way that their radios function. It has a long-standing
tradition of providing a source of engineers who
are born naturals.

Ham Radio awakens in its aficionados a whole-life
fascination with all things technical and gives
an all-abiding curiosity to improve one's scientific
knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience
with ones fellow man, and shows itself in the

gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that
they can construct and operate their own equipment! No-one
else has this privilege. Users, such as broadcasters,
the po lice and armed farces, CBers and mobile phone
users have to purchase ready-made gear. Manufacturers
are not licensed to operate their gear. Radio Hams
are qualified to design, build and then
operate their own pieces of equipment. They do this
with gusto, and also repair and modify their own
equipment. This is a privilege well worth the effort
to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with
relatively simple technologies at first, perhaps making
his own Wimshurst machine and primary cells. Small pieces
of test equipment follow, possibly multimeters and signal
generators. Then comes receivers and transmitters. It is with
the latter that communication with like-minded technically
motivated people takes off. The scope for technical
development grows with the years
and now encompasses DSP and DDS. There is also a great deal
of excitement in the areas of computer programming to
be learnt and applied.

The technical excitement motivates Radio Hams to compete
with each other to determine who has designed and manufactured
the best-quality station. This competitiveness is found in DXing,
competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a
desirable thing to have that there are large
numbers of people who wish to be thought of
as Radio Hams when, in fact, they are nothing
of the kind! Usually such people are a
variation of the CB Radio hobbyist; they buy their
radios off the shelf and send them back to be
repaired; they are not interested in technical discussion
and sneer at those who are; they have no idea how
their radios work inside and have no wish to find out;
they are free with rather silly personal insults;
they have not satisfied any technical qualification
and their licences prevent the use of
self-designed-and-built equipment.

These CB types engage in the competitive activities
with their Cheque-Book-purchased off-the-shelf radios
in a forlorn effort to prove that they are Radio Hams.

No _REAL_ Radio Hams are deceived by such people!

-----ooooo-----

One such CB type is the so-called "Not-Ham". Otherwise
known as the CBer-Masquerading-As-A-Radio-Ham, this type
had their background in the hobby that is CB Radio and not
in the technical pursuits that lead up to a coveted Ham licence.
Easily recognised by their boasts of the criminal activity of
11 metre SSB operation, one wonders why they don't go back to
the CB Bands if such bands are dearer in their hearts than are the Ham
Bands? No _REAL Radio Hams associate with those who made an
illegal installation of transmitting equipment before being
in possession of an appropriate licence.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist
from the _REAL_ Radio Ham is to solicit their view of the
difference between CB Radio and Ham Radio. A Radio Ham will
perceive Ham Radio to be a technical pursuit and will
perceive CB Radio to be a social communications facility
no different in essence to a land-line telephone or a
GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
could also hold a CB licence safe in the knowledge that
such a licence says no more about him than having a land-line
telephone, whilst continuing to regard Ham Radio as a separate
technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between
a Ham Radio licence and a CB Radio licence. To him, they are
sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then
tries to classify himself as the equal of the Radio
Ham when, in fact, he is nothing of the kind. A sure sign of
a CB Radio hobbyist is if he holds, or has ever held, a licence
issued under the gangrenous degeneration that is the
M3/CB Fools' Licence scheme.

-----ooooo-----

One group of people who claim to be of the standard of
Radio Hams but who are in reality nothing more than an
apology for the failure of a CBer are those class B
licensees who falsely proclaimed that they were against
the use of a Morse Test to control access to the HF
bands, until, that is, a test was introduced at their
intellectual level, the intellectual level of 6-year-olds.

6 year-olds simply lack the mathematical tool kit to
enable them to handle even the simplest algebraic manipulation
for Ohm's Law and thus, the disgraceful Class Ber's in
the aforementioned category are not Radio Hams by any stretch
of the imagination!

Remember - A sure sign of a CB Radio hobbyist is if he holds,
or has ever held, a licence issued under the gangrenous
degeneration that is the M3/CB Fools' Licence scheme!

One type not mentioned is the Franklyn, which IIRC is a cross coupled
multivibrator with one feedback path through the rock.

> be 100Hz.
> Serious enough.

Not true.

100 Hz is a huge variation by crystal standards, especially in the lower frequency ranges. If a crystal oscillator drifts substantially during warmup, it usually implies two things:

1) The oscillator is driving the "so-called" parallel resonance of the crystal, which is very dependent on circuit capacitance. I said "so-called" because the parallel resonance isn't really a true resonance of the quartz, it's a frequency where the crystal appears inductive enough to resonate the combinationo fo the holder capacitance and the circuit capacitance.

2) The circuit is poorly designed.

BTW, some here have suggested just purchasing a 'can' oscillator. Be very careful of these, and check the specs carefully. Many 'can' oscillators have an internal programmable RC VCO that is PLL locked to a low frequency crystal. The up-side is that the manufacturer will make any frequency you want (some are even user-programmable). The down side is that RC VCO's have horrible jitter ('phase noise') that isn't corrected by the PLL

~~~~~~
Sounds like you're driving the crystal too hard and it's heating up.
When something heats it expands and a larger crystal has a lower
frequency. If you want best stability, reduce the drive until the
circuit barely oscillates and make up the lower output with a stage of
amplification.

73, Bill W6WRT
~~~~~~

Joe, a minor issue.

Frerking,"Crystal Oscillator Design and Temperature Compensation" (and
a lot of other folks) says the Q of the crystal is: Q = Xl / R,
where Xl is the motional inductance and R is the ESR. Thus the Q of
the -crystal- is not a function of the mode of operation. Short of
drastically changing R, the crystal Q is unaffected by external
circuitry.

If we speak of overall -circuit- Q then that is a different can of
worms.

1358. New program OPANGLE3

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-19 21:51:21 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <dtap8p$a0n$1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 13559

NOW AVAILABLE ** New Program "OPANGLE3.exe"

Choose and set plate current operating angle for Class-B and Class-C
RF power amplifiers.

Input data includes control-grid plate-current cut-off volts, DC
negative grid bias, and peak grid drive volts.

Advice on how to use Tube Operating Characteristic Curves is included.
For interest the plate current harmonic content is computed up to the
21st harmonic.

For given DC plate supply volts and peak plate signal volts, the DC
power input, tuned load resistance, RF power output, plate dissipation
and efficiency are computed.

This is a repeat of program Op_Angle (now withdrawn) with the addition
of an analysis of conditions in the plate circuit.

Program size = 50 kilo-bytes.
Download OPANGLE3 from website below.

....

Hi !

Why do you like to key the oscillator ?
Let it run all the time and key the later stage !

"Thus the Q of
> the -crystal- is not a function of the mode of operation."

Wes,

If you're speaking of the Q of the crystal's inherent series resonance, then you're right. However, most crystal oscillator circuits that we typically see in common use operate in the parallel resonant mode, which isn't a crystal resonance at all. It's the frequency at which the crystal's net inductive reactance resonates the parallel combination of holder capacitance and circuit capacitance. As such, it's quite affected by the circuit around the crystal. When the crystal is operated in a parallel resonant mode as described, the Q of the overall resonant circuit is much lower than the crystal's resonant Q.

I agree, I'm just saying that -- being human -- I'm willing to turn a blind-eye towards some violations of various laws, just as real law enforcement officers do every single day. Now if my job is to enforce, e.g., copyright law and somebody makes me _aware_ of a particular violation, clearly I have to go ahead and prosecute, regardless of what my "blind eye" might do otherwise. (Similarly, I don't in any way buy the excuse of the current crop of phramecists who'll refuse to dispense, e.g., "day after" pills because doing so goes against their moral convictions!)

> In Roy's case on EZNEC, he put in a lot of work in translation

Given that Roy is alive and well (I saw him walking around in Rickreal on Saturday!) and supporting/selling his product, I can think of no rationalization whatsoever whereby pirating EZNEC could be considered "acceptable." Now, 40 years from now when the situation has changed, I may feel quite differently.

Huh? My point was only that -- regardless of what I or others may rationalize and therefore use to relieve our consciouses while we break some law -- original works will continue to be generated so long as there's some sort of income to be derived in doing so. I do agree that there's less and less income to be derived if more and more people go around rationalizing piracy/stealing/etc. in general, and I personally find it a very distrubing

trend that so many people today don't think twice about copying software/music/movies/etc.

> EZNEC is an example that applies here. The work that Roy did on

I don't see any reason he should, unless he chooses too. Although it's interesting to contemplate that EZNEC probably wouldn't exist if it weren't for the NEC core that was developed with taxpayer dollars... perhaps the ultimate outcome of piracy running rampant will be that software development will then only be performed by government-employed programmers? Or hobbyists with no expectation whatsoever of monetary gain from their efforts? I think that'd be a horrible situation, although there are plenty of people out there who firmly believe that most all software should be produced under such a model. :-(

> What it does NOT have for free
> is a way of showing the results in anything but tabular form, no

Not to discount Roy's work -- since, again, he's a talented programmer and his software is clearly worth paying for -- but I do find it disappointing that (in stark constrast to the anecdote in the preceeding paragraph) very little new software comes out of the government today. Why is it that software like OpenOffice has to be developed by 100% volunteers rather than by our government? If you look at universities today, most of the EDA software they use is commercial in nature (donated or provided at a substantially reduced price by the manufacturer) rather than anything written in-house. Heck, back when Roy worked at Tektronix, my understanding was that TekSPICE was the simulation program of the day, whereas now Tek has also switched to commercial SPICE simulators and is very close to completely phasing out the usage of TekSPICE... kinda sad, in a way.

> Without the protection of the copyright law, Microsoft could

Linux and all the other GPL projects are a great service to the community at large and have clearly provided products that otherwise either would have cost much more or simply been out of reach of many people. That being said, Stallman and his associates clearly have an agenda as well -- there's a _huge_ difference between true "public domain" software (such as what the government produces and what the original versions of SPICE and NEC are) vs. GPL'd software. This agenda had led to numerous "me too" licenses (e.g., the lesser GPL license) where people tend to pick and choose which pieces of the GPL they like and even occasionally tack on bits of their own agendas (e.g., they restrict their software from usage by those in the military, the government, even just anyone using it for fiduciary gain, etc.).

Not that there's anything inherently wrong with this -- commercial software licenses are even more convoluted and variegated! -- but people should be aware of the difference.

Ubdoubtedly a poor analogy: Just as when one chooses a religion, there's usually a savior associated with it who performs miracles, promises peace on Earth, etc... but you only get to receive all of those goodies if you buy into the entire package, which sometimes contains all sorts of ideas you oppose! Richard Stallman is then perhaps our modern-day software Jesus/Joeseph Smith/Buddha/etc...

---Joel Kolstad
(who, on occasion, has used plenty of GPL software and thinks OpenOffice is very good and would probably serve the purposes of 90+% of all MS Office users just as well... oh... and GNURadio is pretty cool too...)

I wonder if you bought them from me at the Dayton hamfest? I bought about
90+ of them from a security company for $2-$3 each.
I took a bunch there and sold them all for 30-35 each. They were all sold in
less than half of the first day.
Sounds like a good deal to me if someone wants to set up a 10ghz link. They
have quite a bit of range just with the small stock horn.
Lots of fun on long trips to set off radar detectors :-) :-)

Good Luck with the auction,
RoD

> be 100Hz.
> Serious enough.

That sounds like crystal heating. All of these oscillators can drive the crystal at various drive levels (depending on resistor and capacitor values and/or tank circuit tapping) and different crystals like different drive levels.

A tuning-fork type crystal (e.g. 32kHz watch crystal) is being overdriven if the levels are as high as a microwatt.

Most HF-range crystals will take hundreds of microwatts to a few milliwatts of drive.

Lots of the oscillator circuits in old handbooks are designed around FT-243 crystals, which can take substantially higher drive levels (sometimes the tube oscillator was putting out several watts) than "modern" crystals. And even then those handbook circuits overdrove the crystals to get more power out of the oscillator! By 1950's standards 100Hz of chirp/drift was not a big deal (was probably better than average for most equipment.)

Tim.

http://www.qsl.net/ke5fx/ Thanks for the heads-up. That's v1.05,
the Jan 14, 2006 edition? Which program was updated to fix the
phase-noise problem? The pn program's source code says 13-Jul-05,
although the pn.cpp file date is 12-Feb-06.

I like the part where you get the "number of 1000-ns intervals
since 1-Jan-1601 UTC" :-)

I haven't read all the replies in this thread, so this may have been brought up before... Wenzel Associates make some of the lowest phase noise oscillators commonly available, and on their web site you will find information about keeping things low jitter/low phase noise. You will find some simple, practical low noise circuits there, including crystal oscillator circuits.

Cheers,
Tom

I had one of these and worked 10m DXCC in 90s... later had to sell it and
just now have a used one from ebay. I took apart the dial that was
stuck and repaired the optical tuner mechanism. Now I don't know
if I have a large SWR or if the rig is sick. It jumps freq' when the
RF output power is turned up.
I was hoping to see some more tips and helps but the thread seems to
have been taken over by some sand pile kids with no help other than
flaming any post.

Any ideas why the rig jumps freq? Restarting from scratch. No
Bird or Freq meters yet.

Odd this was run on homebrew LOL

Thanks 73 Gary K4TWO

1381. Crystals wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-22 02:59:28 UTC
From: Gary Schafer <gaschafer@comcast.net>
Message-ID: <nqknv1ps3298rbssb9thjjm5fcgtopb5di@4ax.com>
Source record: 13582

I have a homebrew project that I need some crystals for. Need the
following:

3.300 mhz

3.500 mhz

10.5 mhz

17.5 mhz

24.5 mhz

Prefer HC6 holders if you have them. Any help out there?

Thanks!

Gary K4FMX

1382. The Great Strip-X Substitute Hunt, Part 2

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-22 05:38:33 UTC
From: LenAnderson@ieee.org
Message-ID: <1140586713.373458.313610@o13g2000cwo.googlegroups.com>
Source record: 13583

Not too long ago, I inquired about a substitute for General Cement "Strip-X", an old stand-by on quick removal of the enamel of "coil wire." It was a smelly, blackish gel, came in a small bottle, and wonderful for stripping off coil wire enamel in a minute or two. It isn't made for the electronics hobby trade anymore, but there IS a reasonable substitute: Jasco 0201 Premium Paint Stripper, available at most Lowe's, Home Depot, OSH, True Value chain stores, about $4.75 for a pint.

I have some toroid coils under construction, all using #32 and #34 AWG enameled coil wire. A #$%^!!! to strip those with either single-edge razor blades or fine-grit finishing paper. With the Jasco stripper gel, two dips and a WAIT of about 15 minutes will allow a wiping cloth to remove the enamel without damaging the wire. A lot longer wait than with Strip-X, but it is better than nothing.

The same Jasco paint stripper will also loosen the lithographic designs/labels on small tin cans. [see other post] The newer can paints are tougher than those of 30+ years ago so it might be necessary to use some steel wool to help remove the paint (with the gel still on it). Doesn't appear to affect the steel wool.

The product contains methylene chloride (said to be a toxic substance, especially to Californians and their overly-strict hazardous materials rules). Another brand and product at Do-It Centers had that plus formic acid; didn't get that, a bigger can and it cost about $18. Whatever was in old Strip-X must have been stronger and nastier. [my last bottle dissolved the bristles of the bottle cap brush after sitting for a few years]

So far, the hobby room's production line has been humming along without breaking any fine coil wire in order to solder to the toroid winding's ends.

LenAnderson@ieee.org

1383. Inexpensive small shield enclosures from square tin cans

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-22 05:41:07 UTC
From: LenAnderson@ieee.org
Message-ID: <1140586867.550096.271600@g44g2000cwa.googlegroups.com>
Source record: 13584

If you or your significant-other use some of the specialty tea or coffee products for instant gourmet tea or coffee, do NOT throw out the little cans it comes in...they can be recycled into a variety of enclosures, shield cans, etc., if they are made of tin-plated, light sheet steel.

Of three products tried for this are various Chai Tea boxes available under "Safeway Select" brand at Von's food stores. Those are 3 3/4" wide, 1 3/8" deep, and 3 1/2" high (about 3 3/16" high inside). Those and the other two below all have a lip around the top, ideal for attaching cover plates or whatnot to protect whatever is inside. The aperture at the top is about 3 1/4" wide by 1 13/16" deep.

Through Ralphs food markets is the "Private Selection" brand of flavored coffees and General Foods International Coffee brand (General Foods also at Von's). Those are 4 1/8" wide, 2 5/16" deep, and 2 5/8" high (about 2 3/8" high inside). The aperture at the top is 3 1/2" wide by 2 1/16" deep.

With the outside paint lithography stripped off, they all take soldering very well for insuring all seams can be made conductive (and for weather-proofing if used outdoors). To check for tin-plated steel, use a "refrigerator magnet" to see if it adheres or not. [got lots of magnets, too] While not as strong as a cast aluminum box (as from Bud), they are sturdy enough to hold quite a bit inside. The price (nil) can't be beat! :-)

>Saturday!) and supporting/selling his product, I can think of no
>rationalization whatsoever whereby pirating EZNEC could be considered
>"acceptable." Now, 40 years from now when the situation has changed, I may
>feel quite differently.

Ahem, "40 years from now" may see a COMPLETELY DIFFERENT pardigm
for ALL of "radio!" "Radio" - as a communications medium is only
110 years old...look back to how it was back in 1896 with NO
true active devices. :-)

>>>Only in some sort of idealist world. In the real world, original creations
>>>will be generated so long as doing so puts bread on the table.
>>
>> THIS is the real world. There's no "special case" that justifies
>> that idealistic rationalization you made...it is circular logic in

>original works will continue to be generated so long as there's some sort of
>income to be derived in doing so. I do agree that there's less and less
>income to be derived if more and more people go around rationalizing
>piracy/stealing/etc. in general, and I personally find it a very distrubing
>trend that so many people today don't think twice about copying
>software/music/movies/etc.

"Copying" is a way to keep one's "bread on the table" without
putting that "bread" on someone else's table. The general
rationalization is that it hurts no one (physically) and
intellectual property purloining doesn't involve tangible,
physical things (laws on stealing were based on material
objects taken). As Roy remarked, without the protection on
immaterial property (ideas, creations), there would be NO
impetus originate something new...no "ROI" or Return On
Investment of new development.

>> EZNEC is an example that applies here. The work that Roy did on
>> translation of (free) code, cleaning it up, making it presentable
>> in a meaningful manner to users, was considerable, much more so
>> than just getting the original program code to work. Why should
>> Roy give away such effort?
>
>I don't see any reason he should, unless he chooses too. Although it's
>interesting to contemplate that EZNEC probably wouldn't exist if it weren't
>for the NEC core that was developed with taxpayer dollars...

We wouldn't have SPICE derivatives if it wasn't for the efforts
of the University of California at Berkeley development group
deciding it should be available "free." SPICE itself wouldn't
have existed without the original, much older predecessor ECAP
done by IBM (not exactly free since the FORTRAN code managed to
"migrate" out and be distributed by copiers back in the 50s.
Ohio State's version (OSUCAD) code was published in a book on
the subject by two OSU professors. [irrelevant trivia fact but
illustrates just one of many, many works that have all sprung
from the original ECAP pioneering work on circuit analysis]

The NEC core cranks out numbers, numbers, numbers. [just as
ECAP did on circuit analysis] NO intuitive "feel" for the
results to most folks. The GRAPHICS and organized tabulations
had to be done to make them USEFUL for others. That work is
important but usually overlooked.

>... perhaps the
>ultimate outcome of piracy running rampant will be that software development
>will then only be performed by government-employed programmers? Or hobbyists
>with no expectation whatsoever of monetary gain from their efforts? I think
>that'd be a horrible situation, although there are plenty of people out there
>who firmly believe that most all software should be produced under such a
>model. :-(

I think it will come about as nearly ALL OTHER THINGS in radio
and electronics...via the competitive marketplace. The amount
of WORK involved to develop something almost demands some kind
of ROI to justify it to the developer/innovator.

If we look at what exists now, we get blase' about all the effort
involved to make a product (almost as if "it always existed...")
available for others to use. Too many of us take the THINGS we
have for granted.

>... very little
>new software comes out of the government today. Why is it that software like
>OpenOffice has to be developed by 100% volunteers rather than by our
>government? If you look at universities today, most of the EDA software they
>use is commercial in nature (donated or provided at a substantially reduced
>price by the manufacturer) rather than anything written in-house.

Very little actual "government software" was ever done, nearly
all was hired, contracted outside work. [see the FBI's debacle
over a national database featured in SPECTRUM a few months back]
What "the universities" do is NOT NECESSARILY what goes on in
the rest of the world! True, despite the self-promoting PR of
"the universities!"

Note: I used to be a member of SIGGRAPH when I was interested
in graphics and animation. The "universities" did some
pioneering work there, but the professional animators and
graphics folks have gone wayyyyyy beyond that. One can see
it everyday on television, principally in advertising spots.

SPICE didn't suddenly spring out of nowhere at Berkeley...it had
many, many predecessors. That it became the de facto circuit
analysis program in use anywhere in electronics is BECAUSE the
core was free to use. [I could make a big list out of those
predecessors, but that's irrelevant also here]

>Heck, back
>when Roy worked at Tektronix, my understanding was that TekSPICE was the
>simulation program of the day, whereas now Tek has also switched to commercial
>SPICE simulators and is very close to completely phasing out the usage of
>TekSPICE... kinda sad, in a way.

Before about 1975 there was VERY LITTLE "everyday" use of computer
aided design outside of IC development in the electronics industry.
Computer time was very expensive and had to be justified to the
bean counters (been there, done that, made lots of bean soup).

Tektronix was an innovator in electronics from its start. That
by itself is no right for their forever claiming such things as
the market is the driving force that rules the future. When
the market is using SPICE (almost universally), then they too
must use it in order to compete.

>> Without the protection of the copyright law, Microsoft could
>> never have made that Big Break that started their humongous
>> incoming cash flow.
>
>I think that's somewhat speculative. :-) ...but I don't really know enough of
>Microsoft's history to say for certain.

Not speculation, fact, stated in several books on their history
and the TV movie comparing Steve Jobs and Bill Gates. MS got
their Big Break at an IBM conference room in Boca Raton back
in the very late 1970s. They had the IP lock on the OS and
could then parlay that into their enormous fortune. MS took
advantage of that and applied some good sales tactics to wind
up a virtual monopolist in operating systems of PCs.

As far as IP protection on radio hobby magazines, that's
still up in the air for many. If everyone wants to sit
around and rebuild the regenerative receiver or "design"

two-tube (or teeny two-transistor) transmitters, fine, but that is just re-inventing the wheel for the nth time. Much of the output of the radio hobbyist press (other than new product info squibs and "reviews") is the publishers essentially copying their own old works...for their own profit. [the ARRL Handbook has been such for decades, most of their content already published in ARRL works prior...it makes money for the ARRL to keep the organization alive]

Yes, yes, I understand that some don't like ARRL criticized, which is not good, but they have no real competitor in the USA amateur radio community and are NOT "perfect." :-)

If we don't have IP protection, radio hobbyists will still be at least a half-century behind in most efforts of "radio," the practitioners busy, busy with nostalgic recollection of "the good old days" that were not that "good," just fascinating to individuals (like me) of a long time ago. See "Electric Radio" magazine (not on newsstands, available only by subscription...they have a website for getting such subscriptions), a good magazine but covering only the technology of yesterday (when tubes were the thing). My personal difference with that is that I'm looking forward to tomorrow a LOT more, can't wait to see the new stuff that's about to show up soon. Exciting stuff to me in my racket...and home workshop.

Did you save any of those thin metal boxes AOL was mailing their
CDROMS in a couple years ago? They look to be just thick enough for
some small SMD designs.

Hi to everybody,
I need schematic of an antenna switch witout control cable, for selection I must use coaxial cable.
It will be placed on the mast. I found something interesting on ham newspapers but . . I lost it. via internet I try but if you use some search tool (ie. google) you are sure to find all but not what you are looking for.
Thanks in advance.

Why bother with the stinky stuff at all? And, who wants to wait for 15 minutes before you can make the solder connection? I just tin my soldering iron and leave the little solder blob on the iron and apply it to the end of the wire. In a few seconds, the enamel coating melts off and the solder blob tins the end of the wire at the same time.

It's easy to drive one or two relays, to select one of two or three antennas. Use a capacitor at each end to feed RF through, and a choke at each end to feed DC through. For the two-relay case, from the control end of the coax, apply no DC to energize neither relay, or, say, +12V to energize one relay, or -12V to energize the other. At the mast end, use a series diode after the choke to each relay, in opposite directions. Obviously, use 12V relays. Omit the diodes for only one relay. If the run is very long, it's better to feed the DC as a current--the rated current of the relay--to account for resistance of the line. One way to do that is to use, say, 24V and put a series resistor (appropriate power rating) at the power supply end, equal to the nominal relay coil resistance. That can also protect somewhat against the effects of a DC short across the line. Pick capacitors that work well for the RF frequency you're using, and have low reactance (say less than 5 ohms) at the lowest frequency of interest. Pick chokes that have high impedance over the range of operating frequencies, say 500 ohms minimum. If you don't have much experience building RF things, check out some references for RF construction practices. Without that experience, don't expect to get good performance much above 30MHz.

That procedure works only with certain types of coating. With the good kind, you can let the soldering iron cook it till the cows come home and the enamel is still there.

You can buy your wire specifically to be solder-stripable. I often strip the temperature resistant stuff by scraping carefully with an Exacto knife, then peeling the residue off with a soldering iron -- it may not melt with the iron, but it'll come unstuck once it's thoroughly scarified.

Yeah. I am winding coils with some of the good stuff made for
continuous use at 200C. I heat the ends of the wire to a rosy glow
with a propane torch, and the enamel just turns dark and a little
bumpy. But at least this makes the coating brittle enough to sand
off. It just laughs at solder.

Good grief I wrote that rather late at night.
Have you seen a simple Butler cct using JFETS? The ARRL one uses a
transformer which I rather not use.

Hi Len,

Good response; I just have a couple of minor things to add:

<LenAnderson@ieee.org> wrote in message
news:1140587075.998758.13970@o13g2000cwo.googlegroups.com...

> have for granted.

When you can run down to the local computer store and buy something like a wireless router containing a 54Mbps digital radio with very sophisticated modulation schemes running from some embedded CPU with the equivalent horsepower of an 80386 with 64MB of RAM, all for $39.99, I can see why. :-)

> Very little actual "government software" was ever done, nearly
> all was hired, contracted outside work.

I was thinking of programs such as Berkeley SPICE being "government software," actually.

> What "the universities" do is NOT NECESSARILY what goes on in
> the rest of the world! True, despite the self-promoting PR of
> "the universities!"

Very true, although I think that many univerisites have found -- in the past couple of decades -- a need to become somewhat more aligned with industry in order to continue to procur funding.

> As far as IP protection on radio hobby magazines, that's
> still up in the air for many. If everyone wants to sit
> around and rebuild the regenerative receiver or "design"
> two-tube (or teeny two-transistor) transmitters, fine, but
> that is just re-inventing the wheel for the nth time.

It is, although it can serve as a great educational tool for the person doing it. Since ham radio is -- for most people -- a hobby, re-inventing such radios is about the same as someone rebuliding the engine or transmission on a classic car: The end result is still not going to be as, say, fuel efficient or powerful as a modern design, but someone who understands the basics is then a very large way towards understanding the modern design... if they have any desire to do so.

When you go to student engineering design expos these days, there's usually plenty of wireless interfaces to robots, data collection devices, etc.; they're almost always implemented with a little wireless module where you feed

in digital data, and everything else all the way to the antenna is a black box. What you almost never see is something like a discrete transistor radio design implementing, say, BPSK at 1200bps (which often would suffice for the wireless data transmission needs). Although I find this a little lamentable, I realize that these days indsutry needs a lot more people creating such system- or IC-level designs (rather than, say, 50 years ago when I'd expect that most "electrical engineers" found themselves performing discrete transistor -- or tube! -- design), and I also realize that industry still seems to find graduates who become good RF IC designers, so clearly the problem isn't as bad as I might imagine and is probably more a reflection of just becoming set in my own ways instead! :-)

> Much
> of the output of the radio hobbyist press (other than new
> product info squibs and "reviews") is the publishers
> essentially copying their own old works...for their own
> profit.

Sure, or someone taking an old design and adding a microcontroller interface/LCD/etc. (Seems to crop up a lot with auto-tuners, power meters, etc... I've been tempted to do one of these myself... something like a mobile 2m amplifier for an HT... 300mW in, 30W or so out, with digital display of SWR or whatever... clearly the "core design" of the amplifier and SWR meter has been around for decades now...) Granted, a lot of any "new design" is just modifying old designs with various new ideas, but the ARRL's standard to publish a "new" article is perhaps rather low.

> If we don't have IP protection, radio hobbyists will still be
> at least a half-century behind in most efforts of "radio,"
> the practitioners busy, busy with nostalgic recollection of
> "the good old days" that were not that "good," just
> fascinating to individuals (like me) of a long time ago.

What's missing is some reasonable means of licensing IP to people who want to use it on a hobbyist basis. A lot of the really good speech CODECs out there are legally protected, and although I'm sure the hobbyist developer would be happy to pay some few dollars to play with one, a large company is (typically) not interested in dealing with a single user to license a single instance of their technology... And even if that hobbyist's software is good, he might sell... what... 100 or 1000 copies of it? The royalties from that pale in comparison to licensing a CODEC to a cell phone manufacturer.

As-is, HDTV reception and demodulation by a hobbyist is still legal -- but just barely, as various interests continue to push for "broadcast" flags. HD Radio probably wouldn't be legal at all to sit down and demodulate, but given that it's a proprietary standard, no hobbyist is presently able to do so anyway. I'm all for making sure that owners of IP are fairly compensated, and I believe that most hobbyist are willing to pay to do so, but the commerce models to do it just aren't there yet. How far would ham radio have gotten if it had been illegal to build your own FM radio? Or ATV receiver (since they usually still use NTSC as the baseband format)?

On the upside, today it's easy to purchase RF components that allow one to build radios that have better performance and are cheaper to build than ever before. It's the hardware<-->software interface -- with software defined radios starting to become commonplace -- where you can't just go to DigiKey and purchase a CELP software license off the shelf; this is one of the problems holding back the development of ham radio. Granted, hams could -- and do -- development a lot of these things themselves, but given their technological sophistication, ham radio will now more than ever have to follow commercial standards (as they have with FM, NTSC for ATV, etc. -- it's been a _looonnng_ time since ham radio was _setting_ the standard, although the APRS guys do like to point out that a lot of commercial systems today still aren't as good as they are).

1399. Cost-Effective Fast Data Acquisition, and the LT5506

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-22 18:48:13 UTC
From: Tim Wescott <tim@wescottdesign.com>
Message-ID: <79qdnbB3CpF5LGHeRVn-qw@web-ster.com>
Source record: 13500
Cross-posted to: sci.electronics.design,rec.radio.amateur.homebrew,comp.dsp

I am working on a radio project in my spare time. The proposed architecture will use an LT5506 to bring a signal down to baseband, through some low-pass filters, then into a DSP chip for all the 'real' processing. I'd like to prototype this thing in pieces before I put it all onto one tiny board. So I have some questions for the group:

LT5506, 40-500MHz I/Q demodulator with built-in VGA

Have you ever used it?

Do you know if there's an eval board available (Linear doesn't appear to have anything, but I may not be navigating their site correctly).

Do you know of any alternatives? Something that had built-in low-pass filters would be tres cool.

Data Acquisition:

I'd like to buy (or build, if I have to) an eval board for the LT5506 and acquire chunks of data to feed to a PC. For this I'd need a data acquisition device that could sample two channels at no less than 10kHz; 50kHz would be nicer; 16 bits would be nice but I could live with 12 (for 8 bits or less I can use my 'scope). I've found one that's $400 or so for analog in/USB out -- is that the best I can do? Any suggestions will be appreciated.

Low-Pass Filters:

My thinking right now is that I'll just come out of the LT5506 into passive RC filters, oversample the snot out of the signals, and do a quickie filter-and-decimate before I do the complex signal processing. Anyone know of a really small low-pass filter I could use that would have better performance? The LT5506, naturally, has balanced outputs and its specifications go to hell if you don't use them as such, so any solution will have to accept a balanced input.

Thanks all.

Message-ID: <1140638461.482526.179120@z14g2000cwz.googlegroups.com>
Source record: 13501

The person posting here as "dot" with an ISP at sympatico.ca is a Usenet kook named Lyle Blake who is in the process of harassing 3 other newsgroups.

Lyle recently claimed on another newsgroup that he had a bank of lawyers ready to sue
the Amatreur Radio society in Canada because they would not grant him a HAM license test (hint: he's on a psych disibility and can not afford lawyers)

Lyle has appeared in several other newsgroups in the past (although he specializes in trolling transgendered ones) such as the pascal and Delphi programmers newsgroup.. He strives to create (short term) havoc on newsgroups by making overly nonsensical claims and causing flame wars.

He initially presents as "supportive" and begins by making small innocous posts a group. LShortly after he begins making overtly nonsensical posts which engage people in flame wars.

In a short while you may notice a rash of odd postings regarding black people (he uses the "N" word) and anal related postings - those are Lyle's trademarks.

Lyle specializes in harrassing people in transgendered newsgroups. He is unemployed,lives off a psychiatric disibility welfare check and spends all his time (24x7) on Usenet. He has claimed to be everything from a transexual to to a something he calls a "male-woman" and now claims to be an androgyne.

Here is an example of the things he does (ie. asking a white supremacy group to troll the transgendered groups - check it out!):

http://groups-beta.google.com/group/alt.support.crossdressing/msg/90a062cef46a3bca

More info about him can be found in this FAQ - read it and decide for yourself about him:

http://groups-beta.google.com/group/alt.fashion.crossdressing/msg/9d126cf43e96d908

And this is what the little creep looks like:

The data acq part: just get a stereo USB sound port. 16 bits at 22.05ks/s should be easy. I have one that's 24 bits, and it wasn't anything like $400. You can get 16 bits stereo to 48k or 96k s/s for much less than $100 these days, even isolated. Nice thing about delta-sigma converters is that the antialias filtering is relatively easy. In a design I did some fifteen years ago, I used a five-pole LC filter implemented with little smt chokes and C0G caps that worked just fine* and allowed a wide range of output data rates without changing the filter, but typically you don't need anything like that sort of rolloff if you're sticking to a narrow range of clock frequencies.

Call your local Linear Technology rep for current eval board availability.

Cheers,
Tom

* I was expecting to be able to see some distortion from those little chokes, but distortion from the AAF was well below the 16-bit ADCs' distortion.

Microchip Semiconductor will tell everyone the same about their
PICs (or Atmel about theirs)...and you have a good analogy! :-)

But, as some 1950s-technology hams may grouse, "that's not RADIO!"
[I've heard that bs way too often...grrrr] Those folks can go
look into the Analog Devices ICs such as their various DDS or
log-amp-detectors, all definitely working at RF, not "digital."
Or some of the old (pre-split-up) Motorola definitely-analog
complex arrays for various functions at RF, some still made and
available 30+ years after first introduction. PLL by itself has
made "boxes of rocks" (quartz crystal units) relatively obsolete
after becoming state of the art in communications electronics
around 1970. Look at the 1 GHz RF in cellular telephony and
cordless phones operating at 5 GHz...I got into "pro" leagues
in microwaves at 1.8 GHz in 1954, thinking that a 6-wide rack
of radio relay equipment (using tubes) was "hot stuff"...only
to think of regular use of a 2.4 GHz cordless handset as being
"ordinary, everyday thing" 50 years later.

Hey, the huge electronic supermarket called Fry's is just a
mile and a half from my house here. Lots of low-cost, very-
high-tech "toys" available in there.

If they want to TEACH students what goes on in industry of the
day, absolutely. They've gone insular amongst themselves in
the last few decades...in the teaching part of their activity.

That's true, yes, but those hobbyists have to stay within their
own group to praise their work amongst themselves. I like
some nostalgic things well enough, but I've already lived
through (and worked in) the radio-electronics technology of
the 1950s and do NOT think such is very close to state of the
"radio" art of NOW.

A discrete transistor radio would be too bulky for that purpose.
Also a bit higher on the portable power source demand. :-)

I finally got around to fixing and cleaning up an "old" Sony
AM BC radio that was beloved by my late mother (the D cells
had all stayed in and leaked out while she was ill). Great
AM radio, very sensitive due to an added RF amplifier stage
(rare in designs of 30 years ago and now). [it's so "old"
that the push-pull linear AF stages used coupling transformers]

About the same time my wife got an under-the-cabinet AM/FM/CD
radio for her sewing room station (one wall of a guest room).
That radio has a SINGLE IC that does the PLL functions for
both AM/FM LO frequency control, all the RF-IF-detector stages,
AND includes the time-of-day clock PLUS the LCD display
functions! That IC is only available in very large quantities
(from Asia) but it shows the tremendous amount of mixed-signal
capability of a single IC nowadays.

Well - despite being (originally) a "mustang" EE who DID do discrete tube and transistor stage design - the electronics industry has tons of already-designed ICs for various RF purposes and the folks who thunk them up. The problem is more that they came about for MARKET SPECIFIC applications. Right now one can get almost anything needed for cell phone designs, including the cell site stuff...it has been the market driver for a few years. Maybe automotive electronics is next (some applications using RF for "wireless" things like tire pressure measurement while rolling)? PCs are old hat in the industry since the user market is starting to get saturated.

Case in point for HF range transmitters: Asian designs for CB finals were already in production (in lots of thousands-plus per model) and being sold (by the tens of thousands) before 1970. Motorola started pushing power at HF, avoiding CB but going below and above it in frequency, having lots of designs of PA transistors of some power. Helge Granberg of Motorola bossed a lot of detailed, good Appnotes on the how-to and how-come aspects of various power amplifiers. [Communications Concepts has the ANs available and sells most of the "MRF" power transistors now] Motorola didn't sell as many as they thought and eventually dropped that line (before the double split into ON and Freescale). Yet Asian designers were, at the same time, turning out amateur radio power amplifiers in the 100 to 200 Watt category, lesser power outputs on VHF on their own. Nowhere can be found the depth of detail on design of those Asian HF power amp designs, but the Motorola Appnotes are still studied (even if the "MRFs" are getting a bit scarce). The detailed information EXISTS, but it doesn't exist for public distribution. The market doesn't allow it.

Well, in my view, there's too much ham emphasis on transmitters
and power and mechanical aspect of things. Some other things
have been neglected, but taken up by others selling a product.

Another case in point: Neil Hecht's neat little frequency
displays out of AADE in Seattle. No more than three ICs
(all DIP) on a board plus a 2 x 16 LCD character display
module. The main ingredient is a PIC microcontroller that
does both the frequency counting (!), the display module's
input, AND (optionally) a compensation for IF offset in
multiple-conversion receiver/transceiver models. It can be
mounted IN just about any boat-anchor (or smaller) HF
transceiver and functions the same as a many-IC frequency
counter. Strangely enough, it was "pioneered" NOT by a ham
but a UK experimenter who was interested in getting a simple
frequency counter. The Internet allowed the idea to spread
all over the world. The microcontroller source code for
similar units can be obtained (most places for free) but you
need a programmer to stuff the code into the microcontroller.
Or, find someone to do the PIC's ROM code burn-in for you.

I bought an AADE L/C-Meter recently. Assembled, noting the
extra cost wasn't all that much. It saved adding to my
hobby workload. It is based on the same PIC microcontroller
(but with different code). AADE publishes the schematic
and component details. Had I bothered to learn the PIC
instruction set (prodigious even if RISC), I could have
done the programming myself...after about a thousand hours
of fooling around with routines versus hardware. It was
much easier for me to BUY the whole works, leaving precious
time free for other things.

>What's missing is some reasonable means of licensing IP to people who want to
>use it on a hobbyist basis.

A lot of that IP is already free. A major problem is that
there are too many kinds of programming conventions for
source codes. Few can be "expert" in all of them. Usually
one can be "good" in only one, realistically speaking. As
an example, Microchip has lots of utility routines of
various kinds for free on their website...but one needs to
know the PIC instruction set to make sense of them.

In source code it would be (in my view) better to show the
program flow rather than the code itself. That way anyone
can translate flow into the particular source code they
know. Oddly, most hobbyist programmers don't like to show
flow diagrams...those aren't as "cool" as source code

statements neatly arranged by the source code development
program. :-(

>On the upside, today it's easy to purchase RF components that allow one to

>radios starting to become commonplace -- where you can't just go to DigiKey
>and purchase a CELP software license off the shelf; this is one of the
>problems holding back the development of ham radio.

I don't quite agree with the gist of your argument. SDR is
the new buzzword and it can certainly apply to digital-based
communications (cell phones, etc.) but not necessarily to
the analog HF world.

MOST of the transceivers for amateur radio, HF to UHF, are
ALREADY software-controlled, courtesy of a built-in micro-
processor or microcontroller. For PLL or DDS frequency
control AND display of same, that is a necessity to achieve
incredible (to 1950s standards) frequency control. That
same little digital subsystem can do myriad other tasks to
eliminate the physical mechanics of construction. The
multi-wafer rotary bandswitch disappeared from ham
transceivers on the market decades ago...and it's hard to
get the parts for such rotary switch assemblies now for
any electronic purpose except high-current switching.

Because that ubiquitous internal micro has become so
commonplace, it has led to a "radio box" that is controlled
by a PC. That's a natural extension of the internal
digital control already present. But, having the PC
display the equivalent front panel does NOT make it an
SDR! It's a neat selling point, makes it LOOK high-tech
and "the latest thing" but the PC-controlled "radio box"
is really just another version of the existing manually-
controlled HF transceiver.

IF - and only IF - amateur radio voice communications goes
digital on HF will there be any real need for SDR in ham
radio "bands" (the ones on HF). Right now the existing
analog-only amplifiers and whatnot are mature and quite good
enough. One problem with digital voice is that there isn't
even a hint of a standard protocol or of many experimenters
yielding any results on same. The Data modes allocated now
can make do with peripheral adapters since they are not yet
that numerous on HF.

> Granted, hams could --

Well, if we dwell on such true facts, it will lead to toxic
levels of acrimony in here. :-)

Back to watching HDTV from the Winter Olympics in Turin...

Not the thin ones. About 8 years ago, the Bank of America chain
was handing out "Christmas boxes" of AOL material (including CD)
which were at least an inch and a half deep. Unfortunately, the
box lid folded over the edges of the main box part and that did
not make a good enough metal-to-metal contact along the edges.

The tin-plated steel tea and coffee boxes have plastic-paper
lids (throwaway) and the lip at the top will support a metal
or PCB cover that can be sheet-metal-screw secured in place.
Better raw material for a box to shield RF in my thinking.
Solderability is great anywhere on the surfaces, good for
making connections to the can "ground."

LenAnderson@ieee.org

I know that...used it first in 1968 for prototyping. There's
all kinds of suppliers out there but I'm using up some small-
gauge coil wire first made prior to 1950. :-) "Solder-Eze"
wasn't made back then.

>I often
>strip the temperature resistant stuff by scraping carefully with an
>Exacto knife, then peeling the residue off with a soldering iron -- it

>scarified.

After making a few hundred coils and transformers, I've found
lots of ways to get the insulation off. And easily as many
ways to accidentally cut the wire by such scraping. [that's
why GC's Strip-X was so popular once upon a time...just dip
the end, wait a minute or so, wipe...all clean and ready for
soldering] I've used Gillette single-edge razor blades as
well as steel wool as alternates and those are inferior
methods.

I found out by accident that my 40 Watt iron with a 45-degree
bevelled tip was rough enough to do the "scarifying" if
solder-blobbed and rubbed lightly on the #32 wire (a couple

thicknesses of paper underneath to avoid heat draining). That's not as easy to do as it sounds. That's why I went looking for paint-remover.

The paint-remover technique is better, even with the wait. Very little chance of damaging the end of the coil wire. The active ingredient, methylene chloride, doesn't react with the copper.

When winding toroids by hand without a toroid-winder or its fancy winding bobbin, there's lots of flexure on the ends of the fine copper wire from all the threading-through the hole. Copper is maleable, but there are metal-fatigue limits even with copper. Using something that scars the surface, plus the metal-fatigue phenomenon from dozens of threading movements, makes it easy to damage the ends.

Yes, I've tried fine steel wool in removing enamel from #32 and it is as inferior as perpendicular knife-edge scraping. Such works okay on #26 or larger where one can afford to lose some copper in the process.

1407. Input stage for VHF frequency counter in an FPGA?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-23 03:01:44 UTC
From: cs_posting@hotmail.com
Message-ID: <1140663703.875988.162830@g14g2000cwa.googlegroups.com>
Source record: 13508
Cross-posted to: sci.electronics.design,comp.arch.fpga,rec.radio.amateur.homebrew

The other day I found myself needing a short gate time ~200 mhz frequency counter for an automated test, and since I had an FPGA board on hand I whipped one up quickly. Getting it reading and reporting to my computer was the easy part.

Ah, the input stage....

I've got about 4dBm of RF into 50 ohms to play with - about a volt p-p or a little more if it's high-Z. The output of the device under test has a transformer and then a series cap to create an unbalanced output.

I did something ugly with a 3.3v cmos 7406 varient and a feedback resistor, which works well enough to get an accurate reading on one version of the device under test, but not on the other (both have been verified with real test equipment) It also tends to self-oscillate with no input...

What would be the right way to do this using on hand parts, such as abused logic, little 1:1 or 2:1 RF transformers, etc? One idea is to use another gate with a feedback resistor and cap to ground in the hope of establishing the threshold level, and then using a transformer to swing another input above and below this. Most parts on hand are SMD - which means dead bug construction in SOIC scale under the maginifier - discourages extensive experimentation.

Why do most abuse-of-logic RF applications seem to use NAND gates rather than inverters? From a digital perspective NAND gates are a universal element, but once you tie their inputs together, is there something to be gained from having two inputs in parallel?

Is there a way to use a differential input configuration on an FPGA to input a balanced RF signal directly? Theoretically this should be an FPGA clock input... The device in use currently is an Altera Stratix II, but a Xilinx S3 kit is available.

If ordering things, what would be a good default low supply voltage HF/VHF gain component to have on hand? I seem to recall lots of last-millenium ham designs using the MC1350P video IF amp, but what would make sense today?

Does the FPGA have LVDS option inputs ?
If it is new enough to have those, they are differential
amplifiers, designed for current mode signals, and will work
with thresholds << 1V.
IIRC the LVDS spec has +100mV and -100mV levels.
Normally, they need a common mode bias of just over 1V, and the
better ones will also tolerate rail-rail drive (on ONE ip),
but at reduced speed specs.

Hi Len,

You have a lot of interesting history in there!

<LenAnderson@ieee.org> wrote in message
news:1140657489.953126.33790@g43g2000cwa.googlegroups.com...
> But, as some 1950s-technology hams may grouse, "that's not RADIO!"

Yeah, I'm surprised just how 'neatly' some people seem to be able to decide what is and isn't 'radio.'

> Hey, the huge electronic supermarket called Fry's is just a
> mile and a half from my house here. Lots of low-cost, very-
> high-tech "toys" available in there.

I think it's ironic how the cool fashion accessory today is something like a Motorola Razr phone with its associated millions of transistors buried in numerous ICs running software that even relatively few BSEE's would fully understand without a fair amount of additional study (turbo codes, direct sequence spread spectrum systems, psychoacoustic codecs, etc. not usually being a large part of the undergraduate curriculum...), yet 30 years ago anyway hauling around a brick-sized ham radio or CB was quite the nerdy thing to do... Incredible how times change...

> If they want to TEACH students what goes on in industry of the
> day, absolutely. They've gone insular amongst themselves in
> the last few decades...in the teaching part of their activity.

IMO one of the biggest problems universities face is that everyone is "expected" to get a 4 year degree these days, and yet the reality of the marketplace is that relatively few jobs truly require anything approach that level of "hard core" education. Hence, engineering courses get watered down, and a lot of BSEE of BSCS students end up performing straightforward programming or digital design using techniques that a 2 year technical college could have easily provided them with. Industry has often contributed to this problem, requiring even technical sales people to now have those 4 year degrees... sheesh!

> Maybe automotive electronics is next (some
> applications using RF for "wireless" things like tire pressure
> measurement while rolling)?

I think we're just about there -- I've seen chipsets that'll provide, e.g., some tens of bytes of data once every second or so and consume mere tens of microwatts (on average) to operate; that seems like the kind of thing some clever person can generate just from the rotation of the tire itself using some horribly crude & dirt cheap implementation of a "generator."

> Well, in my view, there's too much ham emphasis on transmitters
> and power and mechanical aspect of things.

What would you like to see more of?

> Another case in point: Neil Hecht's neat little frequency
> displays out of AADE in Seattle.

I haven't used one, but I'm aware of their existance. I bought one of Neil's L/C meters years ago now and put it together myself -- I don't recall if an assembled version was even available as an option then. I came across his web site again recently while tracking down a copy of his filter designer (which includes some very useful hints and tips on various transforms), and was pleased to find that he now gives it away for free, stating that he was selling so much more hardware than software anyway, it wasn't worth his effort to keep charging for the software!

> Oddly, most hobbyist programmers don't like to show
> flow diagrams...those aren't as "cool" as source code
> statements neatly arranged by the source code development
> program. :-(

I always figured they just didn't want to go to the extra effort. :-) I agreee that source code alone usually isn't as good as a clear flow diagram.

> I don't quite agree with the gist of your argument. SDR is
> the new buzzword and it can certainly apply to digital-based
> communications (cell phones, etc.) but not necessarily to
> the analog HF world.

I did mean "true" SDRs, such as GNU Radio, Flex Radio, etc. I think it has plenty of application to the HF world (indeed, the development of digital modes for HF seems much more active than on VHF/UHF, which has always struck me as kinda bizarre given how much less bandwidth is available there in the first place... but of course the fact that you can get a signal to the other side of the planet on 100W in good condition is always a big motivator...)

> IF - and only IF - amateur radio voice communications goes
> digital on HF will there be any real need for SDR in ham
> radio "bands" (the ones on HF).

I agree with you on this (in that, with analog HF modes, you don't really gain that much by using SDR), but I hasten to point out that there's no "real need" for the analog modes either :-). Whether or not that means Yaesu/Icom/Kenwood/etc. actually make a full-blown HF SDR that supports both the traditional analog modes and some set of newer digital ones, I don't know.

> One problem with digital voice is that there isn't
> even a hint of a standard protocol or of many experimenters
> yielding any results on same.

Have I mentioned how some of the best low-bit rate CODECs are proprietary and/or patented and not licensable by a single lowly hobbyist? ;-)

> Back to watching HDTV from the Winter Olympics in Turin...

We have an HDTV tuner but only an "EDTV" TV (an older plasma set), and it still looks fantastic; I've been most impressed.

Thanks. Someone else pointed out the soundcard part off list (d'oh).
Linear Tech doesn't do eval boards for that part, I was hoping maybe
someone knew of someone who does. I think I'm just going to do a
quick-turn eval board myself -- it's one of those itty bitty packages
with the grounding pad in the center, so it pretty much has to be
reflowed to be useful.

You can predict wire length well enough to strip it before you wind the
coil? Wow. I always have to wind the coil, cut off the 0 to 4 inch
miscalculation (I always shade it high), then strip.

One way I've considered doing those heat pads on homebrew boards is to drill a large hole there, say to just clear a 10AWG wire, tin the heat pad, solder the part down, and finally slip a very short (e.g. 0.09") length of tinned #10 into the hole, heating it to reflow to the part, and solder around the the wire to the ground plane. Should work, but haven't tried it (yet). Such a short, fat wire is pretty low thermal resistance. You can also add some heat sinking on the back to pull heat away from the wire stub. Toughest part might be cutting the wire cleanly perpendicular to its axis. A reasonably clean cut followed by a bit of filing would do it, and I can imagine better ways if I were making several.

Cheers,
Tom

For gain, have a look at MMICs. Minicircuits sell them in kits that give you a good range of performance. They're easy to use, and run on a single supply.

I think the idea of using the LVDS inputs on the FPGA is a good one, if you can get that into the clock lines you need to use. Otherwise, you only need a little gain to get to levels you need for logic input. Do your clock input lines have a bit of hysterisis? Do they have high enough input impedance to be used with a step-up transformer? Can you reliably bias the transformer DC return to a point between the hysterisis trip-points. I suspect you can do a better job with your logic-gate amplifier, too. Or you could make a fancier input using one of the very fast comparators.

Cheers,
Tom

Well, I was U-S, (Drafted, for those who don't know) but I tested out
of a three year electronics school while in basic training and was
awarded the MOS for a TV Broadcast engineer. I went straight from basic
training to working in CATV, CCTV, AML type Jerrold Microwave video
links and even a little RADAR work.

What K7ITM suggests is using DC blocks to put a DC control voltage on
the coax, and take it off again at the mast end. You can build your
own with a choke and a capacitor (both components well chosen), or you
can buy them already made. Depending on the company, they're called DC
blocks, line isolators, or bias tees.

These building blocks have three connections; a RF-only connection, a
DC connection, and an RF-plus-DC connection.

Key parameters include DC current carrying capability (which is also
affected by the coaxial cable you use), and SWR/insertion loss on the
RF side.

For low frequencies, SGC (http://www.sgcworld.com) sells DC Coaxial
Line Isolators (SGC catalog 54-70) good from 1.5 MHz to around 250 MHz,
handling up tp 1.5 amps at 25 volts.

At higher frequencies, Minicircuits makes Bias tees good from 1 MHz up
to the GHz range. You can often find these on eBay.

You can also find RF switches (relay and diode) on eBay.

As Jim has said LVDS is a good way. Just watch the common mode input range.
You can use a RF transformer to rebias the DC level to get arround any
issues.

Another way is to use a single ended standard like SSTL and DC bias the
input to the reference voltage used for the SSTL. You do need to have access
to Vref pins on the Spartan-3 to use this technique.

We have support for LVDS and SSTL in our boards but I am not sure about the
Spartan-3 starter kit.

7406 is open collector. Did you mean 7404?

What size feedback resistor? What sort of oscillations?

I've had reasonable luck with that sort of hacking. Not great.

What's the output of your gate look like? Is it cleanly switching
or struggling to switch at that speed?

You might want to skip the external gate and use an inverter
in the FPGA out to a feedback pin. That gets the feedback
covering the input pin that you are really interested in.

the only gain is some PWB layout simplifications and less wasted part
sections.

I am thinking on the order of a single transistor amplifier to go to logic
levels, then characterize it for delay issues.

Indeed an amazing place,(I visited the Manhattan Beach CA store 2months ago) It is also a place with a limited selection of (pre-packaged)discrete components (Rat Shack style) However they only sell semiconductors under the NTE designation code ,so if you need semiconductors ,it is wise to bring a cross-reference table.

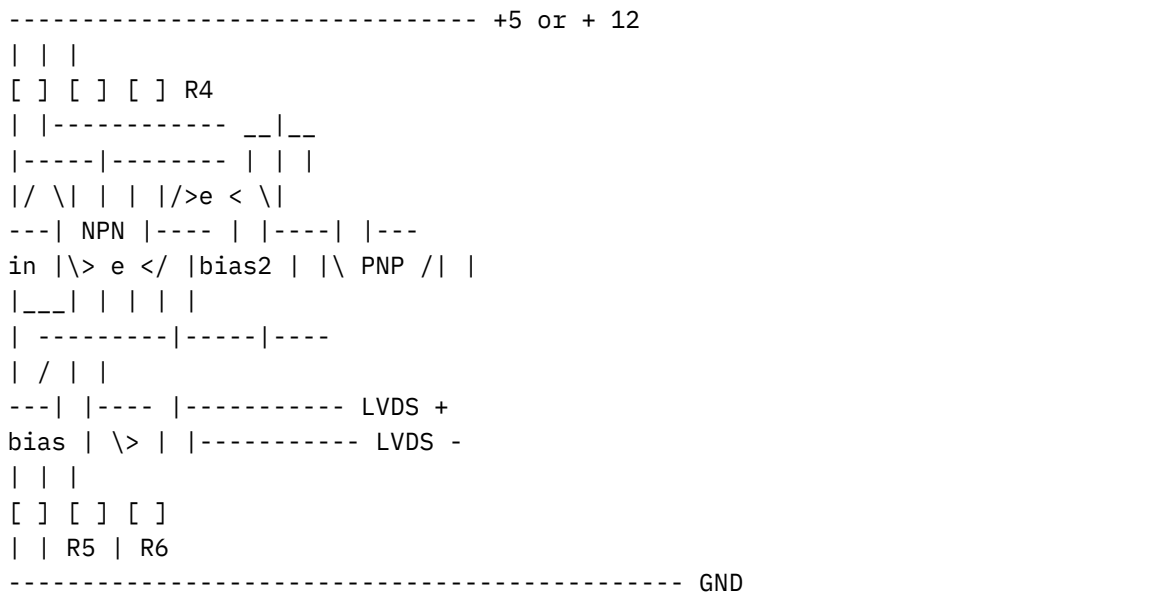
Just a partial reply... I think 7400 series should stop way below 200mHz,
perhaps 50MHz?

I would make a small diff amplifier, did something 40 years ago (yes 40!)
with I think it was BFY90 transistors, then invert with 2 more and drive
the LVDS input.



R4 could be a current source too, set it so it is guaranteed that
the voltage across R5 and R6 (max i in one leg) cannot exceed FPGA
max in.

Gives you some input protection
The 'bias voltages can be generated with diode drop.
No time now to enter it in spice to get response.....
You can use simple junction FETS for the first stage too.

There are also nice chips, but transistors I have always in the box.

It's either a 74AC04 or possibly a 74HC04 (it's upside down so I can't tell) and it's self oscillating at 294 mhz - (it's stable enough for the counter to read... a fast scope shows it approximately as a sinewave.

It seems to be oscillating at about 1/tpd... can't even really pull it much with finger capacitance - only about 10 mhz.

Interestingly, if I short a the floating input-output pair of an unused inverter with the scope probe, that runs a bit slower around 260 mhz... wheras the gate in use has about 20k of resistance in the feedback path.

I may give your transistor circuit a try, either with components or simulation, thanks.

What about using a stand-alone LVDS receiver? Eg. Pericom
PI90LV179W.

I'm surprised any CMOS 7406 variant really goes to 200MHz! I think you
got lucky with the one that did work.

> What would be the right way to do this using on hand parts, such as
> abused logic, little 1:1 or 2:1 RF transformers, etc?

I like high-speed comparators (often called "differential receivers" or
"LVDS receivers" on the spec sheet) for this.

> One idea is to
> use another gate with a feedback resistor and cap to ground in the hope

The nice thing about differential receivers are:

1. Easy to set the comparison level.
2. Lowish input impedance but not too low, such that you set the
impedance by putting a 50 or 100 or whatever ohm resistor there.
3. At least for the non-LVDS parts, there's only one or two receivers
per package so even when it's not SMD it's easy to do dead-bug
prototyping.
4. They already have some semblance of defined open-circuit response
(usually called "fail-safe" for some bizarre reason in the spec sheets)

to prevent oscillating.

> Why do most abuse-of-logic RF applications seem to use NAND gates

Usually the hex inverter packages cost a little bit more than the
4xNAND gate packages. It's nice to have the extra input to act as an
enable etc. And once you start running these parts into the linear
region you probably do not really trust using the other sections for
other functions.

You can even feed in non-balanced RF subject to some limitations.

VHF? MMIC's, at least as long as you have only need for AC coupling.

Tim.

Sounds like you're thinking single-sided board. I was just going to pop
for a quick turn house that delivers two-sided, plated-through holes.
The price is not too bad, all things considered.

Well, I generally do double-sided boards, but the bottom side on a board like that would be (mostly) ground plane/heat sink. The solid copper plug will conduct away a lot more heat than one (or a few) plated holes.

I do agree that the proto shops offer an economical and valuable service, but still do boards myself when they are simple and I want them fast (like an hour or less from the completed layout). Analog layouts generally don't need many vias, and I just fill those with 30AWG wire.

Good luck with your project. I have something somewhat similar going on myself at the moment.

Cheers,
Tom

Wow. Dave Edwards' pristine HP1726 275MHz scope is at $26 right now,
and this 5MHz unbuilt Heathkit is at $169? Guess it must have some
antique/nostalgia value to someone. It will be interesting to me to
check back in 9 days when both auctions end to see what each went for.

From: Joel Kolstad on Wed, Feb 22 2006 7:54 pm

>Hi Len,
>
>You have a lot of interesting history in there!

I feel fortunate to have experienced (first-hand) the
electronics technology revolution of the last 60 years.
Truly remarkable times!

>I think it's ironic how the cool fashion accessory today is something like a
>Motorola Razr phone with its associated millions of transistors buried in
>numerous ICs running software that even relatively few BSEE's would fully
>understand without a fair amount of additional study (turbo codes, direct

>being a large part of the undergraduate curriculum...), yet 30 years ago
>anyway hauling around a brick-sized ham radio or CB was quite the nerdy thing
>to do... Incredible how times change...

Don't forget that MARKETING has been responsible for setting
"the public's" definitions of "cool" things. Lots of the
products on today's market are the work of specialists together
in one product family. It is difficult for anyone to be a
guru in more than one discipline within electronics (and radio).

Take the general MPEG4 compression that enables HDTV to work
within a 6 MHz bandwidth (and enabling 4-channel sound and
assorted whatnot to coexist there). Having been slightly
involved in some test equipment design for same, the concept
is mind-boggling to me. "Tylenol time" to attempt under-
standing it. I'd rather sit back and watch, enjoying the
MUCH better picture of HDTV as compared to the old 4:3 aspect
ratio analog TV. As far as I'm concerned, the compression
techniques are complicated enough that they don't seem to need
any IP protection...

>> If they want to TEACH students what goes on in industry of the
>> day, absolutely. They've gone insular amongst themselves in
>> the last few decades...in the teaching part of their activity.

>level of "hard core" education. Hence, engineering courses get watered down,
>and a lot of BSEE of BSCS students end up performing straightforward
>programming or digital design using techniques that a 2 year technical college

>could have easily provided them with. Industry has often contributed to this
>problem, requiring even technical sales people to now have those 4 year
>degrees... sheesh!

I would "blame" personnel departments for the "degree required."
Hey, it's hard enough for them (now called "Human Resources") to
try to sort out applications in all the myriad specialties typical
of an electronics house in the industry now. Over 30 years ago
RCA Corporation used to give two-level interviews to applicants;
initial screening in personnel, final screening by engineering
department folks (not necessarily liking the task). That was a
better, quicker way to separate the good from the bad and ugly.
I got hired by them that way and later wound up as one of those
who did the second-level final screening. It works.

In practical matters, academia just doesn't have the familiarity
with "industry practice" so it can't get a good handle on what
they really need to stuff in a curricula. That's academia's
problem..."industry" is going to go ahead and do its thing
anyway, regardless of title-rank-status blinged into minds by
academicians. "Industry" exists to stay in existance, make
products, make profits. "Industry" ALSO winds up as the general
inventor-innovator-creator of new technology...they just don't
allot a lot of time to write up much of it a la academicians,
only for marketing purposes to get folks buying their new stuff.

>I think we're just about there -- I've seen chipsets that'll provide, e.g.,
>some tens of bytes of data once every second or so and consume mere tens of
>microwatts (on average) to operate; that seems like the kind of thing some
>clever person can generate just from the rotation of the tire itself using
>some horribly crude & dirt cheap implementation of a "generator."

Well, I'd point out the simple little "fob" transmitter for
the "keyless entry" system. A single IC in there that both
generates the "rolling code" digital sequence AND the tiny
UHF transmitter. The code sequence is flexible enough, simple
enough to set up for tens of thousands of different
combinations, low-power enough to last for years without a
battery change, can work in sub-zero and desert temperatures.
And be relatively cheap to make as well as small enough to
carry in a trouser pocket. One heckuva set of specs there!

The "keyless entry" receiver is as complicated, yet is only a
small part of the overall electronics in a modern auto. My
wife's (she picked it out, I okayed it) new Malibu hatchback
has ten kinds of bells and whistles on its dash display, a
relative drop in the bucket compared to its normal housekeeping
computerized chores of checking things, adjusting carburation,
alert warnings, light control, etc., etc., etc. It's made
possible by the ubiquitous microcomputer (now just thirty-
something old). Wonderful stuff in my view! Takes some of
the worry about cross-country driving as well as everyday

driving.

>> Well, in my view, there's too much ham emphasis on transmitters
>> and power and mechanical aspect of things.
>
>What would you like to see more of?

Receivers, subjects that don't emphasize the new buzzwords
of the industry. Oscillators, some practical skinny that
doesn't mirror the current industry need for "low phase
noise" (applicable to FM and PM yes, but not many DSSS
high-speed data communications going on in amateur radio).
Practical simple test equipment for Rx and Tx that doesn't
need some specialty component part or unobtainium. Most
authors use what they had (leftovers from work or other
projects) and don't mention what could be substituted.

Some better theory and practical uses of complex quantities
that involve impedance and admittance...especially how to
measure them good enough for a home workshop environment.
A vector impedance meter and vector analysis system is just
now (in the last few years) appearing in the ham scene.
Some practical stuff on making inductors, Q affected by
what, how to measure approximate Q with workshop gear.

Some APPLICABLE (not product-specific promotional-based)
information on making things in the home workshop, whether
it is "manhattan-style" PCBs or even better soldering
techniques. [RoHS is with us, like it or not, an tin
solder without the lead doesn't handle as the old solder
did] How to work with materials properly, metal to
fiberglass-epoxy sheet or whatever. Even something on
standard screws, fasteners, things that can hold something
together. Avoid the TV craft-show techniques of most of
the show content concerned with promoting some latest
maker's new stuff...while it is momentarily interesting
it is also obviously a part of marketing pushing this new
craft stuff. ["product reviews" are a gross example of
this kind of PR]

A "tuna-tin two" two-transistor Tx is cute, but crammed
into an Altoids box? QRP is kind of a specialty niche
and probably deserves a special issue of some magazine
for that, but the lure of "simplification" (in size and
complexity) for simplicity's sake doesn't TEACH much of
anything except serve as a real test of dexterity on the
part of the builder. "Simplicity" in ham radio was very
popular from the 30s to the 50s because ready-built was
expen$ive then. Simple things could be built in a few
weekends, provided some enjoyment, but not a great deal
of real learning (other than assembly) into theory. Today
it is possible to build a "simple" single-conversion HF

superhet receiver with zilch problems of image response
yet have fine selective IF response for AM voice. Takes
all of six ICs on a PCB size less than 6" x 8" in size.
Frequency control in tuning can be simple or complex as
desired.

>I did mean "true" SDRs, such as GNU Radio, Flex Radio, etc. I think it has
>plenty of application to the HF world (indeed, the development of digital
>modes for HF seems much more active than on VHF/UHF, which has always struck
>me as kinda bizarre given how much less bandwidth is available there in the
>first place... but of course the fact that you can get a signal to the other
>side of the planet on 100W in good condition is always a big motivator...)

IF - and only IF - the ionosphere is kind to you... :-)

In digitized "data" modes for amateur use, there's only
ONE new, innovated-for-ham-use mode: PSK31. All other
modes involving "data" are adaptations of commercial-use
modes. One mountain-states small company had their first
product as a "beginner's HF PSK31 transceiver." It didn't
sell despite having some neat, modern microcomputer
and display screen, keyboard included. It wasn't
"traditional ham" gear, wasn't pushed by a big company.
Peter Martinez (G3PLX) had his PSK31 up, running, and
being tested by others using it in Europe for a few years
without any real details of it appearing in USA ham
magazines.

There just isn't much of anything else in "data" comms
standards here in the USA unless it is already developed
and debugged by "the industry." Digitized voice IS
possible in narrowbandwidths on HF but there don't seem
to be any amateur experimenters trying it out. What would
SDR do without any standards to adapt to?

One can PROCESS an IF today and do things like make a
digital spectrum analyzer (I don't see much effort spent
on that). That isn't really a Software DEFUNED radio
system. Firmware-software already CONTROLS most of the
functions in modern ready-built amateur radios. That isn't
really Software DEFINED radio either. OK, the quibble is
a minor thing. Software/firmware/digital-control is
definitely on the scene today.

>
>Have I mentioned how some of the best low-bit rate CODECs are proprietary
>and/or patented and not licensable by a single lowly hobbyist? ;-)

Yes, you did. :-) I also mentioned that there's not much of a hint of anyone in the USA experimenting on their own to make a trial or two at their prospective standard. Someone must BEGIN, be the flag-bearer, the amateur pioneer. What is bizarre (to me) is that a modern PC has much more computing power than big mainframes I connected to 30 years ago to do ordinary synthesis-analysis of circuitry. The tools for experimentation on coders-decoders EXIST NOW.

Perhaps the biggest bottleneck to all this possible pioneering is the current mindset of radio amateurs. If it doesn't "look" like "radio" (of their time), it "isn't real radio." :-(

The editors of the few remaining ham publications have the paper-version control over what everyone sees for new things. THEY are the ones needing to look into the future and do gauging on what THEY think is "good" for readers. Meanwhile, the Internet is busy, busy showing lots and lots of new things that ARE done, can be done, to anyone who bothers to search. [there's quite a bit of material on CODECs and general DSP out there once you get the right key search words] Most of what we see on the Internet is not locked up in truly enforceable copyrights.

<snip>

If you want some good results, use a high-speed comparator
device. The Maxim MAX9010 family of comparators is fast
(5 nSec propagation delay) and it works into a TTL load.

At 1 V p-p you've got the input overdrive to insure fast
rise and fall times of the output. Note: 200 MHz (if that
is really what you wanted to write) has a period of 5 nSec
so even this very fast comparator is going to be pushed for
a good output. On the other hand it is STABLE and won't
"go into oscillation with no input."

http://www.maxim-ic.com

Samples are available. One in the family is in a SOT23
package, the rest smaller.

>If ordering things, what would be a good default low supply voltage
>HF/VHF gain component to have on hand? I seem to recall lots of
>last-millenium ham designs using the MC1350P video IF amp, but what
>would make sense today?

The MC1350P is second-sourced by Lansdale. It is still a very
good differential in/out building block with good AGC control.
The MC1349P is a pin/function equivalent and can be ordered from
Dieter Gentzow's PartsAndKits.com at 3 for $3. Same place is a
good source of small-quantity toroidal cores. Both ICs are
called out with 12 VDC supplies but they will work down to
9 VDC with little degredation. Open-collector outputs, constant
5 KOhm || 5 pFd input, AGC control down to 60 db (if needed).

Departing from the subject, those wanting to know the real HF
military communications of '53 to '60 can download:

http://sujan.hallikainen.org/BroadcastHistory/uploads/My3Years.pdf

or

sujan.hallikainen.org/BroadcastHistory/uploads/AlphabetSoup.pdf

Personal history, about 10 MB each so they take some time over
dial-ups.

Harold Hallikainen has a great collection of broadcasting material
of older times (under the org part of the URLs above) plus some
very comprehensive sites in his Links list. Maybe you wish to
contribute something there?

There are some newer low voltage CMOS gates that are much faster than AC series, I think they are called LVC and a few other names depending on the manufacturer. The really fast ones don't support 5V supply operation because they are made on a fine geometry process. This also makes them faster. It would be very hard to stop it from self oscillating with no input signal. In order to have a meaningful way of determining if you have satisfied this requirement for not self-oscillating, you would first have to define what is the minimum input amplitude that you expect it to be able to accept and produce an output with reasonable duty cycle etc. Another approach would be to make an input buffer that does self oscillate and make a separate detector that measures the input signal amplitude and disables the measurement when the input amplitude is below a certain threshold.

snip

The FPGA already has a balanced input, lvds. have you tried that with a
few resistors
or maybe a RC filter on signal to set the treshold on one input and the
signal on the other input? or maybe even a cap into a cmos input
biased to close but not quite vcc/2

1Vpp should be plenty, think the thresholds for ldvs is max 100mv

That sounds like a good idea, because theoretically we actually have some on hand somewhere, I'll have to see if I can scare them up.

While connecting to the FPGA directly would be simpler, I do like the idea of using an external chip as a bit of a 'fuse'. (Though transformer coupling into the FPGA should reduce some risk)

A bit off topic, as it has to do with house wiring. But how does power factor affect dissipation in the conductors? I'm wondering, for example, if a 1500 watt capacity and a 30% power factor would overload #14 wire.

To put it into perspective...NEC allows #14 for up to 15 amps when used
as a conductor in a 3-core cable. The wire alone is rated for 32 amps
for open chassis wiring. I'm not sure how its rated loose in conduit
but I suspect that NEC still treats it as 15 A.
That said, I don't think NEC takes into consideration...or actually they
do in a roundabout way by derating...the power factor variance.
I'd say you are in the clear both from a practical and a 'legal'
standpoint with 1500 watts load. However, if I were doing this from
scratch I'd bump up to #12 or #10 because 14 wire could create an
undesirable voltage drop depending on distance.

1443. Re: A really basic question

Source record: 13544

I'm assuming you're in the U.S. and by "#14" wire you mean 14 AWG.

A power factor of 30% means that only 30% of the product of V and I is power being delivered to a load. The rest is simply being moved back and forth in the power system. To get 1500 watts of power at a power factor of 100%, you need P / V amperes. For V = 120 volts, that works out to 12.5 amps. But to get 1500 watts of power with a power factor of 30%, you need P / V / 0.30 = 12.5 / 0.30 = 41.67 amps. Heating in wires is due to the current going through them. Ordinary #14 wire in houses is rated for 15 amps. So you'd be grossly exceeding the rating of the #14 wire in getting 1500 watts with a 30% power factor. [All voltages and currents in this posting are in RMS.]

When the power factor is less than 100%, you need more current for the same amount of power, because it requires current to move the "reactive power" -- power moved back and forth without being used up in a load.

If by "1500 watt capacity" you actually mean "1500 volt-ampere capacity", then you're ok. In this context, watts are real power, but volt-amperes are the product of V and I, which is the sum of the real power (watts) and "reactive power" (VARs, for "Volt Ampere Reactive"). If you limit your volt-ampere product to 1500 volt-amperes, then your maximum current is 12.5 amps. But if your power factor is 30%, you'll only be delivering 0.30 * 1500 = 450 watts to the load.

This is why you'll generally see transformers and other power devices rated by volt-amperes rather than watts.

Roy Lewallen, W7EL

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.ourmedia.org/node/168474

Topics discussed in SolderSmoke #16:

--EMRFD on mixers and balanced mixers
--LTSpice model for NE602
--Low output from NE602 Bal Mod circuit
--Desitin, diaper rash, and heat sinks
--REVVER web site and Trivial Electric Motor
--Solder smoke in space
--The Simpsons on social skills of Radio Shack customers (us!)

Listen at: http://www.ourmedia.org/node/168474

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.

http://www.ourmedia.org/mediarss/user/36170

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/node/168474

Here's the homepage for our show. All our programs area available here. There is also a blog and links

to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

For heating wire, the I-squared-R losses are what matter. Same for most
small circuit breakers.

1500 watts at 120 volts would be a RMS current of 12.5 Amps, if the
load was purely resistive.

With a power factor of 30%, the RMS current might be 40 Amps. That's a
lot more than the 15 Amps that electrical codes allow on 14-gauge wire.
But you'd be tripping breakers if you really were putting 40 Amps
through that circuit and it's house wiring AND it's up to code AND the
breaker was Ok AND (yadda yadda yadda).

But I don't know what a "1500 watt capacity" is. I don't think you're
really talking about 1500 watts. Maybe you meant Volt-Amps (VA).

Tim.

1446. Interested in _REAL_ Ham Radio? (As opposed to Complete Buffoonery (CB)?) Here's the FAQ for you!

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-24 15:56:07 UTC
From: Plod's Conscience <radio.ham@lycos.co.uk>
Message-ID: <1140796567.271702.34800@v46g2000cwv.googlegroups.com>
Source record: 13547
Cross-posted to: uk.radio.amateur,rec.radio.amateur.policy,rec.radio.amateur.homebrew

When reading this, be on the guard against the Cry Baby (CB),
the Cackling Bully (CB) and the Complete Buffoon (CB)!

What is Ham Radio?

It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery. Even
the Usenet newsgroups dedicated to the cause have degenerated
into a hotbed of abusive onslaughts by those who ought to know better.
However, there still exists the fundamental basis on which Ham
Radio is based, and that will never die. This FAQ ("What Is
Ham Radio?") will be regularly published and will not be
shouted or bullied down. It is important that those of a
technical bent, who are the natural seed-corn of Radio Hammery
and who gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_
to you to exert yourselves to join our fraternity! (If you find
otherwise, then perhaps you are already classing yourself in the
mediocre groups of those who are criticised in the FAQ and from
whom we _MUST_ dissociate? If so - it's never too late for
a re-taxonomisation on your part - there's nothing elitist about
us, and we welcome all those who are prepared to put themselves
out in order to join our ranks!)

-----ooooo-----
So,.....What is Ham Radio?

Ham Radio is a technical pursuit for those who
are interested in the science of radio wave
propagation and who are also interested in the
way that their radios function. It has a long-standing
tradition of providing a source of engineers who
are born naturals.

Ham Radio awakens in its aficionados a whole-life
fascination with all things technical and gives
an all-abiding curiosity to improve one's scientific
knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience
with ones fellow man, and shows itself in the
gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that
they can construct and operate their own equipment! No-one
else has this privilege. Users, such as broadcasters,
the po lice and armed farces, CBers and mobile phone
users have to purchase ready-made gear. Manufacturers
are not licensed to operate their gear. Radio Hams
are qualified to design, build and then
operate their own pieces of equipment. They do this
with gusto, and also repair and modify their own
equipment. This is a privilege well worth the effort
to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with
relatively simple technologies at first, perhaps making
his own Wimshurst machine and primary cells. Small pieces
of test equipment follow, possibly multimeters and signal
generators. Then comes receivers and transmitters. It is with
the latter that communication with like-minded technically
motivated people takes off. The scope for technical
development grows with the years
and now encompasses DSP and DDS. There is also a great deal
of excitement in the areas of computer programming to
be learnt and applied.

The technical excitement motivates Radio Hams to compete
with each other to determine who has designed and manufactured
the best-quality station. This competitiveness is found in DXing,
competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a
desirable thing to have that there are large
numbers of people who wish to be thought of
as Radio Hams when, in fact, they are nothing
of the kind! Usually such people are a
variation of the CB Radio hobbyist; they buy their
radios off the shelf and send them back to be
repaired; they are not interested in technical discussion
and sneer at those who are; they have no idea how
their radios work inside and have no wish to find out;
they are free with rather silly personal insults;
they have not satisfied any technical qualification
and their licences prevent the use of
self-designed-and-built equipment.

These CB types engage in the competitive activities
with their Cheque-Book-purchased off-the-shelf radios
in a forlorn effort to prove that they are Radio Hams.

No _REAL_ Radio Hams are deceived by such people!

-----ooooo-----

One such CB type is the so-called "Not-Ham". Otherwise
known as the CBer-Masquerading-As-A-Radio-Ham, this type
had their background in the hobby that is CB Radio and not
in the technical pursuits that lead up to a coveted Ham licence.
Easily recognised by their boasts of the criminal activity of
11 metre SSB operation, one wonders why they don't go back to
the CB Bands if such bands are dearer in their hearts than are the Ham
Bands? No _REAL Radio Hams associate with those who made an
illegal installation of transmitting equipment before being
in possession of an appropriate licence.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist
from the _REAL_ Radio Ham is to solicit their view of the
difference between CB Radio and Ham Radio. A Radio Ham will
perceive Ham Radio to be a technical pursuit and will
perceive CB Radio to be a social communications facility
no different in essence to a land-line telephone or a
GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
could also hold a CB licence safe in the knowledge that
such a licence says no more about him than having a land-line
telephone, whilst continuing to regard Ham Radio as a separate
technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between
a Ham Radio licence and a CB Radio licence. To him, they are
sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then
tries to classify himself as the equal of the Radio
Ham when, in fact, he is nothing of the kind. A sure sign of
a CB Radio hobbyist is if he holds, or has ever held, a licence
issued under the gangrenous degeneration that is the
M3/CB Fools' Licence scheme.

-----ooooo-----

One group of people who claim to be of the standard of
Radio Hams but who are in reality nothing more than an
apology for the failure of a CBer are those class B
licensees who falsely proclaimed that they were against
the use of a Morse Test to control access to the HF
bands, until, that is, a test was introduced at their
intellectual level, the intellectual level of 6-year-olds.

6 year-olds simply lack the mathematical tool kit to
enable them to handle even the simplest algebraic manipulation
for Ohm's Law and thus, the disgraceful Class Ber's in
the aforementioned category are not Radio Hams by any stretch
of the imagination!

Remember - A sure sign of a CB Radio hobbyist is if he holds,
or has ever held, a licence issued under the gangrenous
degeneration that is the M3/CB Fools' Licence scheme!

Kind of. It is a converter for a BC453 (Q5er) that I built many years
ago. It now uses only one 3.5 Mhz crystal, dual conversion, for all
bands. Trying to clean up some of the image problems.

20 years ago, yes. Nowadays, all those people don't bother about
placing an antenna, they just use MSN messenger. What's left on CB
today are people that love radio.

> they are free with rather silly personal insults;

You should listen to some of our Dutch 2-meter repeaters. And you
should listen to yourself when you talk about CB operators.

* lots of crap cut out *

> One infallible way to disambiguate the CB Radio Hobbyist

Your views are obscured by ignorance. I know many CB operators who are appealed more by technology than all those HAM's who, after passing their exam, never touched a soldering iron in their life anymore.

* Lots of insults cut out *

Fortunately, we have a different view on CB here in Holland. One channel on CB is even an official VRZA home frequency, where official HAMs and CB operators come together to talk about their hobby. The result: they attend our meetings and start to study for the 'real' HAM status.

Don't repell them, attract them.

Hans (PD0AC), Almere, the Netherlands

That anyone is subjected to a malicious, misleading
and perjurous complaint to the plods is a reflection
on the complainer and not on the victim.

Brian Reay subjected me to a scurrilous,
distressing and grossly offensive campaign of harassment
over a two-year period when he regularly accused me of
sheep-shaggingand of drinking methylated spirit. He said that
my wife was a sheep next to me in the bed. It is difficult to
understand the relevance
of such a campaign to the pursuit that is Ham Radio, but he
found it within his psyche to so behave.

That he conducted that campaign when he was under
training as a teacher in a girls' school in Dartford is very,
very worrying now that the matter of Ian Huntley has been
brought once again into our consciences.

That he is a sexual pervert who is obsessed with sheep
shagging is in no doubt. That he is a danger to children
because of that obsession is also in no doubt. That he
should not be employed in _ANY_ capacity in any school
because he repeatedly published his obsession in an
international news group to which children have access is also
in no doubt.

When "the worm turned" and I finally made a stand against
his grossly offensive tirade, Brian Reay made his
false complaint to the plods. That he attempted to hide the
true nature of what had passed is a further reason why he
is unsuitable to be employed in any capacity in any school.

>You can predict wire length well enough to strip it before you wind the
>coil? Wow. I always have to wind the coil, cut off the 0 to 4 inch
>miscalculation (I always shade it high), then strip.

If the toroid calculator calls out about 30 turns or less (on a
half-inch OD core), yes, then I use the program's wire length
call-out. More turns and the manual winding isn't ideal and
the stripping has to be done after the winding is complete.

I was thinking of a 100+ turns on a toroidal core where the coil
(I should say magnet wire to be modern) lay can't be as perfect
as a toroid winder. Then there's no good, practical accounting
of the wire length ahead of time.

When faced with lots of turns like the above, and using very
small wire, there's a bit more anxiety and care needed when
trying to take off the enamel for close-to-the-core stripping.

Construction thier own gear
announcing ..

G8IFW

I built my own PSU regulated, and better than trio kenwood,
1- 20 amps 12v

built my own ATU - after looking at many designs
built my own design

Photos to proove

Designed my own aerial, different to what ive seen on
the net and got 9+ to belgrade 40m SSB 50w

but even though, finding the parts prooved to be hard
even though I have 2 electronics shops local

anyone got any air spaced 200w 500pf vairables
to sell ?

Im glad the free democratic world can operate
on amatuer radio without other peoples opinions being forced down their
throat

yes we must have standards
and yes its about time the standard QSO should be about
people talking together not some copy of a miltery test

if one has to eat dictioneries
one would be better off getting a life
wouldnt one

over articulation, well thats democratic freedom as well,

we could try and see the good in the new changes

Sheep

well one day i met a customer who went on holiday in Greece
he picked up the local news paper and was suprised
(so woz i)

it said the following story

the police was driving along a country road
and they saw a man in a field being curious and a beady
eye they stopped and looked and decide to jump over
the fence and arrest a man who was having sex with a donkey
(im not suprised) (you dont know greek donkeys)
anyway it turns out he was an english man from east london
who was hauled into Court the next day

He haw he haw He haw

anyway the conversation went on about welsh men
now this is ..... ?????
another customer present at the time said he Knew a woman who
worked on a Welsh Farm and this lady actually witnessed some of the
farm workers shagging the sheep, for real

bahhhd baahhhd

well opinions maybe, but when witnessed by others it is what it is

Keith

what next, Gay camels,
Transvestite horses

any way the good news about this news group is we have conversations
not some pretend militery operating proceedure.

and i still dont see anyone writing E mails in morse do you ?

anyone disagree just say your readability 5 rig here is XXX QTH is XXX
73eees good bye

that was pointless

The facts:

YOU are a loony. Quite correct
YOU are an alcoholic, by your own admission
Elizabeth is a figment of your imagination. Probably has 4 legs and woolly
jumper.
You are going to get into serious trouble sooner than later.

Just look for "heat-strippable" wire, or wire with solderable polyurethane insulation. I've seen "polythermaleze" as one brand name. And as for the "better" insulations that are not heat strippable with a low-temperature/controlled-temperature iron, simply use more heat. I suppose Teflon or polyimide coated wire would be a problem, but I'm sure there aren't many amateurs winding with those, and in any event, both would be a problem for paint strippers. I doubt very many ham applications require better wire than you can get in solderable polyurethanes.

http://www.bulkwire.com/ is one source of magnet wire. I'm not sure if they have a minimum order. I've also gotten odd-number sizes from Amidon Associates. Also, if you have a local motor rewind shop, they may just give you a small amount--though they may not have #34AWG.

http://www.essexgroup.com/News_Media/White_Papers/thermalclass.pdf may be of interest to the curious.

Or see
http://eraser.com/catpdf.cgi/magnet.pdf?mode=download&catpdf_id=11 for a supplier of strippers and stripping equipment (no, no--just for stripping WIRES!).

Cheers,
Tom

well it come to pass
a nice man was having trouble with his aerial
so he met others
and they had similar troubles
he said well I give a good bang
every friday night and still nothing happens
so we thought is it in the right position ?
and the other men said
no nothing yet
well wot about a SWr
he say ar Swr all the F******* time

Hi Guys,

I am contemplating building a 144MHz power amp and looking at various options. The obvious solution is a pair of push pull 4CX250Bs.

It appears that the Gi7B and family of Triodes can provide an equally capable solution. They appear to be much easier to cool, by something like an Axial Papst Fan (instead of a Snail Blower). The other obvious advantage is not having to deal with Screen voltage, regulation and protection. The triodes also look much easier and cheaper to mount (given the grounded grid). Finally, it seems because of the very low inter-electrode capacitances, it is quite easy to parallel the Triodes up as required (even at 432MHz).

So what is the down side for using these Triodes ?

Comments and observations appreciated as usual.

Regards,

Mark.

This ain't some simple RF amplifier. I meant that ghost communication,
or transdimensional communications, is the next frontier, for those
that are brave enough not to listen to the scientists, skeptics, and
debunkers that will tell you it's impossible because it scares the crap
out of them, or goes against some brain dead theory of how life, and
physics is supposed to be.
After six years of working on these projects, you can imagine how many
idiots I've encountered that are so sure they know better.

In general triodes work best in grounded grid as you then
don't have to neutralize them. At 144mhz I'm not sure HOW
you would neutralize them. Triodes in GG take more drive
power than the tetrodes, so your driver stage need to be
beefier.

I'm not familiar with the tubes in question but one idea
would be to use them grid driven in push-pull with cross
over neutralization. Much easier than trying to come up
with a neutralization scheme for a single ended amplifier.

You will need less drive in this configuration, but still
more than with the tetrodes. But you will save money
on the screen supply.

Down side? Wonder what the sockets cost? At least the
4cx250's can use surplus loctal sockets. (Though the
ceramic kind are a bit hard to find, they are out there
and cheaper than REAL 4cx250 sockets.)

Since all the frequencies in question are harmonics of 3.5mhz

(except 3.3mhz) you could use a PLL to generate them by phase
locking a vco to the harmonics of a 3.5mhz oscillator.
Use a divide by N circuit to divide down the vco output to
3.5mhz and have a phase detector compare the output of the
divider with the 3.5mhz oscillator. Properly shielded,
this pll would be as clean as the crystal oscillator.

My apologies for missing the start of this thread, but what is it that
you are trying to achieve here?
If you are looking for some assistance in building a particular circuit
I would certainly like to help. I have been a ham for almost four
decades, with a strong tilt towards building rather than operating.
My experience with the scientific and skeptic community is that they
would actually _LOVE_ to see some real evidence of the paranormal,
rather than debunking it as a matter of principle.
If you have a workable proposition we could take it to JREF,
<www.randi.org> and collect a nice $1million.
I would really like to be able to do that.
Let me know,

Ma> Regards,

Ma> Mark.

Having never built one I feel completely at ease if you disregard my
comments. First thing that comes to mind is in general since triodes
have less gain they will require more drive and a lower input Z.
That isn't meant to discourage anyone however since triodes are
obviously used successfully!

> That sounds like a good idea, because theoretically we actually have
> some on hand somewhere, I'll have to see if I can scare them up.

Found one and wired it up as the datasheet suggests - cap coupled input to half the differential pair, the other side floating at the reference output pin voltage with decoupling cap to ground, terminating resistor across the pair. Worked quite well.

The xilinx S3 kit from digilent doesn't seem to be designed with using the differential input capability as the pairs are split up all over the place. Not certain that I couldn't bias one input of a pair as a reference wherever it is and drive the other pin wherever that is, but putting it all in a little package seemed simpler.

1514. The Weekly FAQ (Reposted after thread was hijacked by the very Childish Broadcasters (CBers) warned against.)

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-25 08:43:55 UTC
From: Plod's Conscience <aiyr.r.bean@lycos.co.uk>
Message-ID: <1140857035.791153.194860@p10g2000cwp.googlegroups.com>

Cross-posted to: uk.radio.amateur,rec.radio.amateur.policy,rec.radio.amateur.homebrew

This is reposted because this week's thread was hijacked by the
very Childish Broadcasters (CBers) warned against. Remember that
Ham Radio is a technical pursuit for gentlemen, and not some
mindless operating hobby for Cheque-Book (CB) wielding thickos!

Jealously guard and foment what we have achieved!

When reading this, be on the guard against the Cry Baby (CB),
the Cackling Bully (CB) and the Complete Buffoon (CB)!

What is Ham Radio?

It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery. Even
the Usenet newsgroups dedicated to the cause have degenerated
into a hotbed of abusive onslaughts by those who ought to know better.
However, there still exists the fundamental basis on which Ham
Radio is based, and that will never die. This FAQ ("What Is
Ham Radio?") will be regularly published and will not be
shouted or bullied down. It is important that those of a
technical bent, who are the natural seed-corn of Radio Hammery
and who gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_
to you to exert yourselves to join our fraternity! (If you find
otherwise, then perhaps you are already classing yourself in the
mediocre groups of those who are criticised in the FAQ and from
whom we _MUST_ dissociate? If so - it's never too late for
a re-taxonomisation on your part - there's nothing elitist about
us, and we welcome all those who are prepared to put themselves
out in order to join our ranks!)

-----ooooo-----
So,.....What is Ham Radio?

Ham Radio is a technical pursuit for those who
are interested in the science of radio wave
propagation and who are also interested in the
way that their radios function. It has a long-standing
tradition of providing a source of engineers who
are born naturals.

Ham Radio awakens in its aficionados a whole-life
fascination with all things technical and gives
an all-abiding curiosity to improve one's scientific
knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience
with ones fellow man, and shows itself in the
gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that
they can construct and operate their own equipment! No-one
else has this privilege. Users, such as broadcasters,
the po lice and armed farces, CBers and mobile phone
users have to purchase ready-made gear. Manufacturers
are not licensed to operate their gear. Radio Hams
are qualified to design, build and then
operate their own pieces of equipment. They do this
with gusto, and also repair and modify their own
equipment. This is a privilege well worth the effort
to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with
relatively simple technologies at first, perhaps making
his own Wimshurst machine and primary cells. Small pieces
of test equipment follow, possibly multimeters and signal
generators. Then comes receivers and transmitters. It is with
the latter that communication with like-minded technically
motivated people takes off. The scope for technical
development grows with the years
and now encompasses DSP and DDS. There is also a great deal
of excitement in the areas of computer programming to
be learnt and applied.

The technical excitement motivates Radio Hams to compete
with each other to determine who has designed and manufactured
the best-quality station. This competitiveness is found in DXing,
competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a
desirable thing to have that there are large
numbers of people who wish to be thought of
as Radio Hams when, in fact, they are nothing
of the kind! Usually such people are a
variation of the CB Radio hobbyist; they buy their
radios off the shelf and send them back to be
repaired; they are not interested in technical discussion
and sneer at those who are; they have no idea how
their radios work inside and have no wish to find out;
they are free with rather silly personal insults;
they have not satisfied any technical qualification
and their licences prevent the use of

self-designed-and-built equipment.

These CB types engage in the competitive activities
with their Cheque-Book-purchased off-the-shelf radios
in a forlorn effort to prove that they are Radio Hams.

No _REAL_ Radio Hams are deceived by such people!

-----ooooo-----

One such CB type is the so-called "Not-Ham". Otherwise
known as the CBer-Masquerading-As-A-Radio-Ham, this type
had their background in the hobby that is CB Radio and not
in the technical pursuits that lead up to a coveted Ham licence.
Easily recognised by their boasts of the criminal activity of
11 metre SSB operation, one wonders why they don't go back to
the CB Bands if such bands are dearer in their hearts than are the Ham
Bands? No _REAL Radio Hams associate with those who made an
illegal installation of transmitting equipment before being
in possession of an appropriate licence.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist
from the _REAL_ Radio Ham is to solicit their view of the
difference between CB Radio and Ham Radio. A Radio Ham will
perceive Ham Radio to be a technical pursuit and will
perceive CB Radio to be a social communications facility
no different in essence to a land-line telephone or a
GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
could also hold a CB licence safe in the knowledge that
such a licence says no more about him than having a land-line
telephone, whilst continuing to regard Ham Radio as a separate
technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between
a Ham Radio licence and a CB Radio licence. To him, they are
sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then
tries to classify himself as the equal of the Radio
Ham when, in fact, he is nothing of the kind. A sure sign of
a CB Radio hobbyist is if he holds, or has ever held, a licence
issued under the gangrenous degeneration that is the
M3/CB Fools' Licence scheme.

-----ooooo-----

One group of people who claim to be of the standard of
Radio Hams but who are in reality nothing more than an
apology for the failure of a CBer are those class B
licensees who falsely proclaimed that they were against
the use of a Morse Test to control access to the HF
bands, until, that is, a test was introduced at their
intellectual level, the intellectual level of 6-year-olds.

6 year-olds simply lack the mathematical tool kit to
enable them to handle even the simplest algebraic manipulation
for Ohm's Law and thus, the disgraceful Class Ber's in
the aforementioned category are not Radio Hams by any stretch
of the imagination!

Remember - A sure sign of a CB Radio hobbyist is if he holds,
or has ever held, a licence issued under the gangrenous
degeneration that is the M3/CB Fools' Licence scheme!

Agreed. The sense of help and encouragement shown towards all newcomers to
the hobby is very lacking. Is it any wonder a few give up and go 'off the
rails'...

How are beginners expected to "put themselves out? when the only way to "hammery" is through the M3 direction?

To be proud of yes but jealously guarded? How are you going to guard it... by demanding Morse be set at 20-30 WPM in_all_classes of "Hammery"

> The excitement that drives a Radio Ham starts with

A bit like CB really. You start off with a basic package, you get more interested and learn the technical skills to install your own station and some go on to build their own antenna arrays, repair their own radio's and that of friends then some decide to take it a step further into the Amateur radio side of things only to meet up with people like you in the forums who welcome with one hand then dismiss immediately with the other with long winded diatribe...

> The technical excitement motivates Radio Hams to compete
> with each other to determine who has designed and manufactured
> the best-quality station. This competitiveness is found in DXing,
> competitions and fox-hunts.

Just like CB, I remember the fox-hunts we had in the late 70's - early 80's and what fun they were too. I remember also the joys of DX on 11 metres, especially the competitions and the sense of achievement in contacting those far away stations. Seems the two hobbies are similar after all... (How dare I make that comparison eh...)

> However, beware! A Ham Radio licence is such a
> desirable thing to have that there are large

> their radios work inside and have no wish to find out;

Then that is appalling as most CB'ers I know are now Amateurs and are quite respectable too. They have always shown a fascination in radio, in it's DX use and internal workings and antenna from their CB days to today...

> they are free with rather silly personal insults;

You mean like "Childish Broadcaster" "Cry Baby" "Cackling Bully" "Complete Buffoon" "Criminals" "M3/CB fools" calling men who question them "girls" and so on... yes, very silly...

> they have not satisfied any technical qualification
> and their licences prevent the use of
> self-designed-and-built equipment.

You mean they haven't completed a multi-guess ticky box test? Well, unless someone's completed one of those then they obviously must know nothing at all...

> These CB types engage in the competitive activities
> with their Cheque-Book-purchased off-the-shelf radios
> in a forlorn effort to prove that they are Radio Hams.

Like probably over 90% of "Full" Licence Amateurs who prefer to build only some bits of kit and have an "off the shelf" radio as their main tool...?

> No _REAL_ Radio Hams are deceived by such people!

Are you sure?

> in possession of an appropriate licence.

Several people even in this group have admitted to installing and using 2 Metre equipment before they actively became Amateurs... and some of these 'illegal's are even teachers of the hobby now...

> One infallible way to disambiguate the CB Radio Hobbyist
> from the _REAL_ Radio Ham is to solicit their view of the
> difference between CB Radio and Ham Radio. A Radio Ham will
> perceive Ham Radio to be a technical pursuit and will
> perceive CB Radio to be a social communications facility
> no different in essence to a land-line telephone

No disagreement there... CB radio was devised originally as a "service" for the community to keep in local touch with each other. Then anyone wishing to Advance would learn more and become a licensed Radio Amateur. Pretty straightforward stuff really.

> or a
> GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
> could also hold a CB licence safe in the knowledge that
> such a licence says no more about him than having a land-line
> telephone, whilst continuing to regard Ham Radio as a separate
> technical pursuit.

Maybe not separate, but a more advanced hobby yes. With the advent of mobile phones and just about every UK home having a telephone of some description why would a Radio Amateur wish to use a CB as a land-line especially as the average CB set up has only a 5 mile radius? Your argument on this point holds no water.

> A CB Radio hobbyist, on the other hand, sees no difference between
> a Ham Radio licence and a CB Radio licence. To him, they are
> sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then
> tries to classify himself as the equal of the Radio
> Ham when, in fact, he is nothing of the kind.

No CB'er I have ever met or known has ever considered or classed himself as a Radio Ham. Maybe if you had said M3 Licence holder I could agree with you to a point...

A sure sign of
> a CB Radio hobbyist is if he holds, or has ever held, a licence
> issued under the gangrenous degeneration that is the
> M3/CB Fools' Licence scheme.

Floored statement once again. Every prospective Amateur needs to sit the M3 test before he advances (or not) and may have even only held said licence for a couple of weeks to make sure he/she is comfortable with the hobby before moving on... It is the ONLY route into "Hammery" now...

> One group of people who claim to be of the standard of
> Radio Hams but who are in reality nothing more than an
> apology for the failure of a CBer are those class B
> licensees who falsely proclaimed that they were against
> the use of a Morse Test to control access to the HF
> bands, until, that is, a test was introduced at their
> intellectual level, the intellectual level of 6-year-olds.

Another completely floored argument. Please state how many 6 yr olds hold an M3 or any other radio licence. I bet you could count them on one hand. Just because a 6 yr old 'could' pass the test if he/she is intelligently bright enough doesn't mean any 6 yr old can pass it. At 6 yrs old you are still very very young and immature and as I have said previously, unless the parents who are Amateurs themselves push their siblings into the hobby they certainly wouldn't think of it themselves... And before anyone comes back saying how simple the test is, then yes, for you it would be but not to a 6 yr old.

> 6 year-olds simply lack the mathematical tool kit to
> enable them to handle even the simplest algebraic manipulation
> for Ohm's Law and thus, the disgraceful Class Ber's in
> the aforementioned category are not Radio Hams by any stretch
> of the imagination!

All because they weren't interested in Morse code, that antiquated communication method pre-dating last century and rarely used now apart from by a few 'die hard' Amateurs. It was a different story back in the 40's and 50's. We don't even light beacons anymore to warn of invasion. Time to move into the real world Mr Evans...

> Remember - A sure sign of a CB Radio hobbyist is if he holds,
> or has ever held, a licence issued under the gangrenous
> degeneration that is the M3/CB Fools' Licence scheme!

No need to comment further here...

I would love to see the answers he would give to my questions but I won't hold my breath...

He would be too busy thinking up his next diatribe against the police and "not-hams" to concern himself with me...

From the Cambridge Dictonary,

"Definition
foment
verb [T] FORMAL
to cause trouble to develop:
Example,
"The song was banned on the grounds that it might foment racial tension.""

Cause trouble, that would be about right for you beanie.

The Magnum wrote:

> How are beginners expected to "put themselves out? when the only way to
> "hammery" is through the M3 direction?

They can take the tests as that is the route they have to take. But
they certainly don't have to lower themselves to actually applying for
an M3 callsign! Maybe they could take one of the TWO all day sessions
that Brian mentioned and go straight to a Full licence. It's just a
shame this facility isn't offered ALL the time. Brian still hasn't
given a good answer as to why that facility isn't available ALL the time!

> To be proud of yes but jealously guarded? How are you going to guard it...
> by demanding Morse be set at 20-30 WPM in_all_classes of "Hammery"

That would be a good start. At least we'd get rid of a lot of the chaff
that has no intention of progressing up the so-called progressive
licensing scheme (a.k.a. an M3 licensee of more than one year). If
there had been a 20-30wpm Morse test when they got their M3 farce
licence, then they would never have bothered and Amateur Radio would
have been a better place as a result.

> Just like CB, I remember the fox-hunts we had in the late 70's - early 80's

Just curious.... was that 11M DXing on SSB? Can't really see what
excitement there would be trying to DX with 4W of FM!

> No disagreement there... CB radio was devised originally as a "service" for
> the community to keep in local touch with each other.

So, why were you DXing on it if it is only to be used as a local service?

> Please state how many 6 yr olds hold an
> M3 or any other radio licence.

We have been asking Brian and the RSGB to release these non-personal
stats for ages but for some reason they always avoid the question.
Brian says he would be uncomfortable doing so himself, so why doesn't he
with his Board position of "Amateur Radio Development" within RSGB Ltd
get them published in RadCom. There really is no good reason why these
stats cannot be published unless they are trying to hide something.

Another interesting stat would be the percentage of M3s that have
progressed any further!!

> All because they weren't interested in Morse code, that antiquated
> communication method pre-dating last century and rarely used now apart from
> by a few 'die hard' Amateurs.

You obviously don't listen to the HF bands much then! Morse code is
alive and well and is being used by a LOT of people. Take just about
any recent DXpedition in the past few years and look at the breakdown of
the QSOs regarding CW v SSB. Usually the CW totals are far ahead of the
SSB totals. "Rarely used".... you have no idea what you are talking
about! Or maybe you just hear all those funny noises at the low ends of
the bands and as you don't understand Morse code you are prejudiced
against it. Just a wild guess :)

Err, FT817 at Martin Lynch.... £448.99. Covers all the bands you
mention and not even close to £1000, in fact, not even half that amount.

FT817 gives you access to 17.44MHz of Amateur allocations in any mode
for £448.99. A typical 80 channel CB gives you access to about 0.8Mhz
in FM only.

Price per MHz for the FT817 = £25.74
Price per MHz for the CB = £62.50

No wonder all these CBers are clamouring to get an M3 licence. As they
say, it's multi-band and multi-mode CB on the cheap!

There is some of that, but woe betides those who let their beliefs cloud
interpretation of the results. Skeptics and scientists remain first and
foremost skeptics and scientists. It would have to be very compelling to
even pass a first scrutiny.

Be sure to check the output with a scope.

Years ago, I used a PECL=>TTL part. That was real/old, 5V TTL.
The problem was that I really wanted a CMOS output and what I
got was a TTL signal that only went up to 4V or so. We had to
run it through an AC dead-bug to get what we wanted.

Good point to keep in mind. In this case though it's all 3.3v
families, and LVTTL seems to have nearly the same Vih/Vil spec as
LVCMOS. The part is spec'd with minimum Voh of 2.4v.

Like you say, it isn't available all the time. Also some people have to
study to advance as they are new to the hobby and can't do it all in a day.
Applying for the callsign gives them the opportunity to self learn on the
bands as well as studying for it. I totally agree though that there should
be a time limit on M3 licence holders before they are asked to advance or
leave the hobby as their indifference isn't in Amateur radio's best
interest.

Judging by many peoples comments in the newsgroups and a few Amateurs I have
spoken to face to face many feel the hobby would have all but died compared
to what it used to be if the insistence of Morse was upheld especially to
that degree.

> excitement there would be trying to DX with 4W of FM!

Yes, it would be DX'ing on 27.555MHz USB and probably more like 15w than 4. Yes it was illegal but the achievement felt by making that contact when others didn't think it could be done gave many a great sense of an achievement rather than something that could be achieved so easily on Amateur radio. If it is easy what's the point? Also I lived in Wales for a time and it was not unknown to have contacts throughout Europe on 4w FM because I managed it a few times myself. That was on UK27/81 legally too.

> > No disagreement there... CB radio was devised originally as a "service"
for

>
> So, why were you Ding on it if it is only to be used as a local service?

Because some found it was possible to do and was quite interesting. When CB was first introduced it was thought DX was impossible and many people who had fought for AM believed FM would only get them "down the road". I used it for both. Mainly to keep in touch with local friends (These were the days before cell phones were commonplace) and talking to the locals and other mobile stations when driving. CB is still un-beatable for that quick 10-13 (Traffic report) on the road ahead. DX was just an un-expected bonus.

That would be useful information and figures would not and should not make anyone uncomfortable in divulging. No-one was asking for specifics so for one I cannot see Brian's reluctance in this matter. He could just say there are 15 M3 licensed 6 yr old Amateurs. Now that in itself could not possibly make someone feel uncomfortable. If he was asked to prove it by giving out their call signs then that's a different story... but no-one is.

> against it. Just a wild guess :)

You seem to miss my point on this subject every time we are in discussion about it so I will say it again... I hold no ill judgement to anyone who wishes to use Morse. I have no problem with Morse and I believe it is down to the individual Amateur and should not forced on them to obtain 'superior' status. Nor do I think it fair to mock "lazy-assed B's" simply because they aren't really interested in Morse but are interested in everything else. Morse isn't the be all and end all of Amateur radio. So there may be more using it than I think..Compared to the amount of licensed Amateurs though I bet it's pretty low in comparison. Let's ask Brian again if he can give us any statistics on this?

> >> Remember - A sure sign of a CB Radio hobbyist is if he holds,

with!

Not really, the point was already answered several times so there was no real need to comment further. Just like now really but I thought I might. Besides which it's an open forum and disagreements can be aired quite openly.

Regards,
Graham

As far as the "control" of tube amplifiers ...
G3SEK has very good boards for both Triode and Tetrode tubes
http://www.ifwtech.co.uk/g3sek/

Triode
http://www.ifwtech.co.uk/g3sek/boards/triode/triode-1.htm

Tetrode
http://www.ifwtech.co.uk/g3sek/boards/tetrode/tetrode-1.htm

But that is simply not true and the statistics on the IARU website prove it. The total number of Amateurs in the UK was increasing year in, year out, and that was *before* either the Novice (now Intermediate) or Foundation licenses were introduced.

However, the number of RSGB members was *reducing* year in, year out, over the same period so the only reason RSGB Ltd backed these unnecessary licence schemes so vigorously was to try to get more members. They did not have the interests of Amateur Radio at heart, all they were concerned with was keeping their commercial book publishing company alive!

same could be said of the ARRL but in both cases the organzation were
neither leading nor following nor getting out of the way, that is
likely the reason for the drift in the ARS over the last few years

but it is fact the insitance of Ham that Morse was somehow vital has
made us look like buffoons to rest of the folks out there that
perception is dangerous not so much from a numbers standpoint but from
the stand as being seen as worthy of the bw we hold

In the UK, licences are renewed annually so those statistics on the IARU website are of licences that had been renewed in the previous 12 months. That makes the statistics very valid in proving the point I was making! Numbers were increasing year in, year out.

Now, had the licences only been renewed every 10 years like in the States (soon the be every five years in the UK) then you may have had a valid point.

1544. Impedence mismatch into FET preamp

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-26 09:54:49 UTC
From: Samuel Hunt <shunt010@hotmail.com>
Message-ID: <dtrtt8$s5n$1@nwrdmz03.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 13395

Hi all.

I have a FET preamp, tuned by means of two fixed capacitors and one variable inductor that serves as an impedance transformer.

Am I correct in thinking that if there is an impedance mismatch (say the input circuit was tuned into a 50 ohm load, then was finally presented with say a 105 ohm load), then the preamp's noise figure would increase and the FET would start to become artificially noisy?

Then if the FET was pushed into overload by an adjacent strong signal, the noise would then start to reduce.

I have this odd situation on a repeater, and I can only put it down to mis-tuned cavities. I've never come across it before though, where the repeater actually IMPROVES in sensitivity when the transmitter keys up (?!?!), so I would like to know what's going on before I fix it.

Thanks all,

Sam

Hi,

I built a Ten-Tec 1054 kit and I don't seem to be able to pick up any stations. I've rechecked all the parts and they are all in the right place and oriented correctly. I get a lot of static, but nothing that even sounds like a signal. I live in Chicago. Are there a lot of stations that can be picked up from here? I'm using a 6 foot antenna. Any suggestions?

A simple sanity check is to check the AM band.

1552. +7dB from BFO to diode ring mixer?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-27 07:33:04 UTC
From: aadu.adok@gmail.com
Message-ID: <1141025584.002935.174890@t39g2000cwt.googlegroups.com>
Source record: 13403

hello,

can someone please explain me, what does it mean that DBM diode ring
mixer expects +7dB from BFO?

I do understand that from BFO comes out some peak-to-peak voltage (2.2
volts for example).
But how does it scale to +7dB?

thanks

1553. Re: +7dB from BFO to diode ring mixer?

Message-ID: <1141034363.277170.286850@i40g2000cwc.googlegroups.com>
Source record: 13404

hi.
it's not dB, it's dBm and it's a measure of power. the diode mixer has
a finite input resistance (read also impedance). as such a voltage
applied to its input causes power to be generated and consumed there. 0
dBm is defined to be 1mW of power into 50 ohms. 7dBm equates to 5mW of
power into a load of 50 ohms. this amounts to 500mV RMS, or
approximately 1.5 volts PTP across 50 ohms.
so you have to produce 5 mW of power to drive a regular DBM . there are
also special ones requiring up to 50 mW or more for proper performance.
Hope it helps:
Saandy 4Z5KS

> Any suggestions?

Does the regeneration control let you turn the "whooshing" on and off? The most sensitive position is where the whooshing is just starting, but generally after you find a station you tweak the regen control for best audio.

If you have a frequency counter you ought to be able to stick the probe near the antenna jack when the "whooshing" is happening and check the oscillator/detector frequency to see if it's in the right band and that the tuning knob makes it move.

The 49M SW band (5.7-6.1 MHz roughly) should have many big-power broadcasters in the evenings your local time. Several religious broadcasters, Radio Haiti, Radio China, Radio Taiwan, Radio Netherlands, BBC, etc. Propogation has been pretty poor lately and signals on the higher frequencies (say 9MHz and above) are not booming in like normal, but still there's a few powerhouse broadcasters that you ought to be able to hear during the day.

Ham bands aren't as crowded as they used to be, unless it's a contest weekend. 6 feet of wire on a regen might be marginal. But I'd expect you to pick up a couple of 40M CW signals most evenings as well as the SW broadcasters on the 41M band (7.1-7.4 MHz roughly).

Tim.

To figure out your current draw:
Amps = Watts (in Kw) X 1000/(voltage X 1.732 X Pf)
Thats a very low power factor, what are you running?

There are various dBx measures of real signal characteristics. The most common ones that I know of are dBm (dB over 1mW), dBV (dB over 1V, presumably ignoring impedance and therefore really just a fancy-pants amplitude measure) and dBc (dB under carrier, very important stuff to measure phase noise in an oscillator or transmitter).

Presumably you could define the 'x' in dBx to be anything -- if you were married many times, for instance, dBxmil would be a measure of the number of ex mothers-in-law you have in the room with you, but I'm not sure if that should be 10 log (N) or 20 log (N).

Hi

Look also following link
http://www.burle.com/cgi-bin/byteserver.pl/pdf/8121.pdf

I am using 3pcs of those 8121 in parallel in my HF linear.
My linear is class AB1 passive grid type.
I feed drive to a small 50 ohm dummy load and from this dummy is a tight
RF connection to the grids.
Drive need for 3 parallel tubes is QRP level. Only some watts.
8121 is designed for side airflow cooling.
I made myself a common socket for 3 tubes from a piece of transparent
mica plate.
I made smal holes in 3 circulars and installed single female connectors
from my junk box to the holes.
The connectors stand on the surface of mica. Only pins are going through
mica
Tubes will sit nicely and firm in these connectors
Plate connector is just a simple round aluminium belt around the plate ring.

RF power limitations (power into antenna) for the UK amateur radio
licences are expressed in dBW 26 dBW equals 400 Watts
15 dBW equals 32 Watts etc .

Hi,

The regeneration control doesn't seem to do anything when I turn it.
Can I check the frequency near the antenna jack with an oscilloscope?
I'm used to digital electronics and this is the first r/f project I've
worked on.

Sam-

There may be some measurable increase in a preamp's noise output, but a 2 to 1 mismatch will probably not cause such a serious degradation in its noise figure.

Perhaps I misunderstand you. When the noise reduces due to overload, that is NOT the same as an improvement in sensitivity. That is commonly refered to as desensitization (desense). An amplifier's gain is reduced to zero when it is in saturation (or oscillating).

Inadequate or mistuned cavities can cause desense. It can also be caused by poor shielding, often from poor co-axial cable. You might benefit if you switched to double-shielded cable. Also look for poorly attached connectors.

The broken version was 1.05, but I "slipstreamed" the fix into the same release without updating the version stamp.

I really should've bumped the version number when I posted the fix, but it'll be pretty obvious if your copy has the bug. It will appear to work, but it will always start the PN sweep at 0 Hz rather than the minimum offset you specify. That makes the sweep take much longer than necessary, and the trace information at offsets below 10x the analyzer's minimum RBW is meaningless.

Basically, if you downloaded it around the time I posted all those auctions, you probably got the bad version.

Heh... I've wondered where Microsoft came up with that; it might have come from the Unix world. There's a lot of weirdness in the calendar business, and it's usually less arbitrary, but more obscure, than it seems at first.

The fact is I get voices of mostly an unknown origin that are surely not broadcast, and radio fragments, often they call me by name, first and last. I have a site with some examples http://franksumption.tripod.com/ on top of the home page is a list of links, these are pages in the site, most of which are voices received on my ghost box, some intelligible, some not so much. On the schematics page I put up photos of this fisrt dead bug board I made. The object of that being to reduce the number of baords in the system so I can use a smaller cabinet.

What you say about scientists/skeptics is untrue. There is absolutely overwhelming evidence out there that would probably stand up in a any court for the existence iof paranormal activity, and it's almost completely ignored by the scientists, and lied about by the skeptics/debunkers. It's been my experince the scientists that say they would love to see the evidence are looking with thier eyes closed! Then claim they didn't see anything.

Not only does this system let me record voices of what seem to be spirits, they will speak direct while the system is running via the monitor speaker.

This point of this whole discussion, I guess, was hoping for interested parties, and sharing information.

The system I've made is a method of developing a random audio source, which the spirits/entities use to form their voices. It works like white noise used for EVP, but the result is much louder, and clearer voices. White noise, and my system work on some kind of random energy principal. It's the randomness that seems to allow spirits to get their voices across.

I would think you could simply scale all the dimensions of your 151MHz H
down by a factor of 151/166.

For example, if the "crosspieces" of the 151MHz H are 39" long.. then
for a 166MHz H, they'd be 39*(151/166) = 35.5" long. You'd likewise
scale the distance between the two crosspieces.

Depending on how it's assembled (and whether you still need it for 151)
you could just cut down the 151 antenna.

1570. Need H antenna help

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-28 08:45:17 UTC
From: Jim <jbasi@cfw.com>
Message-ID: <465a6$440371dd$d80c3ad5$3334@NAXS.COM>
Source record: 13414

I need help in building an H type of tracking antenna for use around 166-167 mhz. This is for wildlife tracking. I have a couple of handheld 3 element Yagi's that I built using YagiCad to do the math, and they work well, but they are big and clunky.

There are times when I am willing to sacrifice the good f/b ratio of the yagi for convienience, for instance when working in brushy woods. I have used an H for tracking at 151 mhz, but of course, I can't use that one for 166.

My tracking receiver, a King portable, has a BNC connector, so I can interchange antennas quickly.

Is there a web page or magazine article that can help me design my H, or can someone share their experience?

Thanks
Jim

Hi Fred and all....

It's not due to desense. When I tune the cavities up properly, there's about 10dB noise figure on the preamp (reciever is 0.8uV sensitive). Then when it transmits, the noise figure doesn't change.

When I tune the notches off slightly so the preamp starts to desense, the noise figure goes down as it starts to desense, then the noise figure goes up high as it pushes the preamp well into desense.

I'm going to retune the cavities for minimum SWR at some point anyway (we've got problems with the frequency and a deaf repeater is actually quite a good idea at the moment, so it's not an issue), and see what that does.

I just wanted to try to understand why it's doing this, does the FET noise figure increase with an impedance mismatch on the input, and so pushing it into desense reduces the amount of noise on the preamp?

It's just an interesting thing I've never come across before and would be interested to find out a technical explanation to it all.

Thanks all,

Sam

1575. Re: Impedence mismatch into FET preamp

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-02-28 17:49:34 UTC
From: K7ITM <k7itm@msn.com>
Message-ID: <1141148974.021206.227170@p10g2000cwp.googlegroups.com>
Source record: 13426

It's important to realize that the optimum match for noise is in general NOT the same as matching the impedance seen at the FET input. The optimum impedance to match to is the FET's input-referred noise voltage at the frequency of interest, divided by the corresponding noise current. RF transistor data sheets will often list the impedance for optimum noise figure. The difference between impedance matching for maximum power transfer and lowest noise figure can be significant. This is true with both bipolars and FETs.

Not sure what's going on with the change in noise as the repeater keys up. Any chance some of the xmt RF is being rectified and changing the bias on the preamp?

Cheers,
Tom

Here is a one of a kind modular 4CX1000 linear amplifier that will run the legal limit with 15 watts drive. Uses motor driven tank circuit components, with digital readouts on a modular control panel, operated with toggle switches.

How are you measuring this? How do you hook the signal generator to
the system when you check the sensitivity with and with out the
transmitter on?

It sounds like a mis tuned duplexer but by what you are saying it is
hard to tell what you are seeing.

hello,

I'm building my first reciver. I can't choose what kind of mixers
should I use. I have read that diode ring mixers are far superior
compared to dual gate mosfet mixers.

Is this true for both - first (RF / VFO) and second (IF / BFO) stages?
Or is there any real difference at all?

thanks

That would be the current per phase into a three phase load.

Paul

It depends on what you mean by superior. The mosfet mixer has gain
and usually has a lower noise figure. The diode mixer will have superior
strong signal handling (higher IP3), but will have about 7dB loss. The
diode mixer needs more local oscillator power. They both make excellent
mixers if they are applied properly.

To get the most bang for your buck, it is hard to beat a ring of
1N914 or 1N4148 diodes at a few cent each. The ferrite 'cups' from
scrap Toko IF transformers can be used as cores for the trifilar
wound transformers.

There are a few other options you should consider. High level IC mixers
like the AD831 are worth considering. Switching mixers using MOSFETs
are capable of very high performance. Search for info about the N6NWP
front-end from QST Feb 93 or the H-mode mixer used in several recent
homebrew designs.

http://xoomer.virgilio.it/sergiocartoceti/article_7.htm
http://www.warc.org.uk/cdg2000/introduction.htm

If you build the receive mixer as a separate module,
you can try them all and pick the one that works best for you.

> compared to dual gate mosfet mixers.

"Superior" is something of a loaded word. Whether a particular parts is superior or not depends on your design intent.

Probably the most popular mixer for simple HF receivers is the NE/SA 602/612. This is an active mixer. It has amazing amounts of gain, such that an RF stage is almost never needed. It is extremely simple to deploy, and it requires almost no power. Thus, in portable/battery powered circuits it is almost always the mixer of choice. It has an absolutely horrid TOIP. There are other, mostly older, even poorer, active mixers, but the 602 is a very versatile part, so it seems to show up everywhere.

At the other extreme are diode ring mixers. These can have stellar TOIPs, but take a lot of oscillator power. Further, they need lots of RF as well, so some sort of RF stage is needed. All this adds up to a need for plenty of power. The best diode ring mixers will use matched, Schottky diodes, but good old 1N4148's do work, and quite well. Many designs use packaged diode ring mixers such as those from Minicircuits.

The dual gate MOSFET falls kind of in the middle. It doesn't have the horrible TOIP problems of an active mixer, but it's not as power hungry as a diode ring. The MOSFET seems to have fallen out of favor lately, in spite of being a "balanced" sort of solution. I suspect most designers are either going for power consumption or performance, and really, quite good performance can be had with the active mixers with careful design.

> Is this true for both - first (RF / VFO) and second (IF / BFO) stages?
> Or is there any real difference at all?

Careful design can manage what the second mixer sees more easily than than the first. This can make the dynamic range problems of an active mixer less of an issue. For that reason, balanced designs that tend toward management of power consumption will sometimes use a diode ring for the first IF and an active mixer for the second. But a superhet bent all out on power conservation will almost always use a pair of 602's. Designers who want to avoid ICs for whatever reason will use a pair of diode rings.

I shouldn't sound so down on the 602. A WELL-DESIGNED 602 receiver can easily match the performance of the $1000 class rice box rigs. It cannot,

however, come close to the performance of an equally well-designed diode ring rig. But the diode ring rig will probably consume three times the power, meaning three times the heat to deal with and the associated oscillator compensation issues.

So you picks your poison.

Also keep in mind that more power=more heat

If you are building a simple analog VFO, temperature compensating the VFO
can be the most tedious part of designing a receiver. Depending on how
tight your box is, the difference in heat could be an issue. Keeping the
oscillator stable while delivering more power also means more buffer stages
between the VFO and the mixer.

If you are designing with a DDS, of course, all this is pretty much moot.
With a typical DDS chip and a packaged clock oscillator at some high
frequency, the oscillator will draw so much current and generate so much
heat that what the mixer requires is invisible.

I have recently bought the books from the RSGB which contain all of the Technical Topics columns from RadCom for the last couple of decades or so. It seems like they really like making mixers from FST3125 Bus Switch ICs, and up to perhaps 50MHz these are supposed to be much better than the average diode ring mixer. They call the configuration "H-mode" and the guy who I believe is supposed to have come up with the idea is called Colin Horrabin. Here is an article randomly selected from a google search:
http://
xoomer.virgilio.it/sergiocartoceti/pdf%20files/IK4AUY_%20qex_07-2004.pdf
I don't like the way they generate the LO signals with XOR gates but apart from that it is interesting.

Chris

Some of the modern DDS chips require little power. Analog Devices
has some DDS chips that draw less than 50ma at 5v, I think there is
one that takes but 15ma. True a vfo will draw even less, but we
